## Restricted Rights Legend

U.S. GOVERNMENT RESTRICTED RIGHTS. UNPUBLISHED -- RIGHTS RESERVED UNDER THE COPYRIGHT LAWS OF THE UNITED STATES. Use, duplication, or disclosure by the U.S. Government is subject to restrictions set forth in FAR Section 52.227-14 Alt. III (g)(3), FAR Section 52.227-19, DFARS 252.227-7014 (b) or DFARS 227.7202, as amended from time to time. Contractor/Manufacturer is BMC Software, Inc., 2101 CityWest Blvd., Houston, TX 77042-2827, USA. Any contract notices should be sent to this address.

---

## Contacting BMC Software

You can access the BMC Software Web site at <http://www.bmc.com>. From this Web site, you can obtain information about the company, its products, corporate offices, special events, and career opportunities.

### United States and Canada

**Address** BMC Software, Inc.  
2101 CityWest Blvd.  
Houston TX 77042-2827

**Telephone** 713 918 8800 or  
800 841 2031

**Fax** 713 918 8000

### Outside United States and Canada

**Telephone** (01) 713 918 8800

**Fax** (01) 713 918 8000

---

---

## Customer Support

You can obtain technical support by using the Support page on the BMC Software Web site or by contacting Customer Support by telephone or e-mail. To expedite your inquiry, please see “Before Contacting BMC Software.”

### Support Web Site

You can obtain technical support from BMC Software 24 hours a day, 7 days a week at <http://www.bmc.com/support.html>. From this Web site, you can

- read overviews about support services and programs that BMC Software offers
- find the most current information about BMC Software products
- search a database for problems similar to yours and possible solutions
- order or download product documentation
- report a problem or ask a question
- subscribe to receive e-mail notices when new product versions are released
- find worldwide BMC Software support center locations and contact information, including e-mail addresses, fax numbers, and telephone numbers

### Support by Telephone or E-mail

In the United States and Canada, if you need technical support and do not have access to the Web, call 800 537 1813. Outside the United States and Canada, please contact your local support center for assistance. To find telephone and e-mail contact information for the BMC Software support center that services your location, refer to the Contact Customer Support section of the Support page on the BMC Software Web site at [www.bmc.com/support.html](http://www.bmc.com/support.html).

### Before Contacting BMC Software

Before you contact BMC Software, have the following information available so that Customer Support can begin working on your problem immediately:

- product information
  - product name
  - product version (release number)
  - license number and password (trial or permanent)
- operating system and environment information
  - machine type
  - operating system type, version, and service pack or other maintenance level such as PUT or PTF
  - system hardware configuration
  - serial numbers
  - related software (database, application, and communication) including type, version, and service pack or maintenance level
- sequence of events leading to the problem
- commands and options that you used
- messages received (and the time and date that you received them)
  - product error messages
  - messages from the operating system, such as `file system full`
  - messages from related software

## About This Book

This tutorial is intended for first-time users of MAINVIEW for DB2 and Rx/D2. It takes you step-by-step through practice sessions with several fundamental product applications.

**Note:** You will need appropriate DB2 authorization to execute certain steps.

---

## Conventions Used in This Book

The following syntax notation is used in this tutorial:

- Items you type and keys you press are highlighted with **bold** letters.
- An item in CAPITAL LETTERS must be entered exactly as shown.
- Items in lowercase letters are values you supply.
- A vertical line | separates alternative options; one must be chosen.

The term pop-up refers to an ISPF pop-up display that replaces the original screen image.

**Note:** Throughout this document, MVDB2 refers to MAINVIEW for DB2 and MVDB2/DC refers to MAINVIEW for DB2 – Data Collector.

---

## Related Reading

This book is included as part of the MAINVIEW library, which documents all your MAINVIEW products and the tasks associated with using these products.

Several books from the DB2 Performance products and DB2 Administration products libraries are also included to help you install the selectable components of MAINVIEW for DB2. These components are also used by other DB2 Performance products provided by BMC Software.

See the “About This Book” section of Volume 1 of the *MAINVIEW for DB2 User Guide* for more information on

- The MAINVIEW library
- The DB2 Performance products and DB2 Administration products libraries
- The MAINVIEW for DB2 Library
- Other recommended reading

A glossary of terms is included in the *Using MAINVIEW* book.

---

## Chapter 1. Quick Reference Card

This chapter contains a quick reference card for your use. You can tear it out and keep it by your terminal if you wish.

It contains

- A brief list of where you should start looking when you want information about a certain topic
- Examples for defining requests

### **Important**

If you are a new user, be sure to go through each of the practice sessions in the rest of this book before using the quick reference card.

## Quick Reference Card

## MAINVIEW for DB2

### Where to Start

To See	Start Here
MAINVIEW for DB2	Option D on MAINVIEW Selection Menu, then Option 1 on DB2 Solutions submenu
Multiple DB2s	EZDSSI Easy Menu (standard windows-mode entry point)
One DB2	EZDB2 Easy Menu
Applications analysis	EZDBA Easy Menu
DB2 topic index	EZDTOPIC Easy Menu, or TOPICA, TOPICB, etc.
Tuning wizards	EZDWIZ Easy Menu
All windows-mode views	<ul style="list-style-type: none"><li>MAIN view—organized by category</li><li>VIEWS view—list of all views</li></ul>
A full-screen-mode service from windows mode	<ul style="list-style-type: none"><li>Various hyperlinks in views</li><li>TRANSFER target product;service Examples: TRANSFER DB2P DB2;LOG or TRANSFER DB2P DB2;EX LOCKD</li></ul>
A windows-mode view from full-screen mode	<ul style="list-style-type: none"><li>Option V on Primary Option Menu</li><li>TRANSFER target MVDB2;view</li></ul>
Status of all DB2s	STDB2 view
Detail status of one DB2	STDB2D view
Current threads	<ul style="list-style-type: none"><li>THDACTV view</li><li>USERS (full-screen mode)</li></ul>
Current locks	LOCKD or LOCKU (full-screen mode)
Lock contention analysis	<ul style="list-style-type: none"><li>Lock Analysis tuning wizard (WZLOCK view)</li><li>LKEVENT or LKEVSSI views</li></ul>
Data sharing analysis	Data Sharing tuning wizard (WZDSHAR view)
Page set and I/O analysis	EZDPS Easy Menu
Buffer pools	EZDBFRPL Easy Menu
Group buffer pools	<ul style="list-style-type: none"><li>EZDSSI / EZDBFRPL Easy Menus</li><li>Data Sharing tuning wizard (WZDSHAR view)</li></ul>
Monitors	EZDB2 / EZDSSI Easy Menus: Monitor section hyperlinks
Exception messages	<ul style="list-style-type: none"><li>ALERTS views</li><li>Journal log (chronological), DB2EX (full-screen mode)</li></ul>
Workload objectives	EZDB2 / EZDSSI Easy Menus: Monitor section hyperlinks
Current traces	<ul style="list-style-type: none"><li>EZDB2 Easy Menu: Thread section hyperlink</li><li>Option 4 (full-screen mode)</li></ul>
History traces	<ul style="list-style-type: none"><li>EZDB2 Easy Menu: Thread section hyperlink (HTLOGS)</li><li>Option 5 (full-screen mode)</li></ul>
Recent workload history	<ul style="list-style-type: none"><li>EZDB2 Easy Menu: Thread section hyperlink (HTLOGS), drilldown</li><li>Option 6 (full-screen mode)</li></ul>
DB2 catalog information	Catalog Manager Browse, from EZDB2 Easy Menu or specific object hyperlinks

### How to Activate Requests

- **To define requests for automatic startup** (BLKDMRW member in BBPARM):

- Summary Trace example

```
REQ=ATRAC THRDHIST  TYPE=SUMMARY  TITLE='THREAD HISTORY'  STORAGE=4000K
LOGTRAC=Y  TRNUMDS=3  TRSWTIME=24:00  TRDSN='Mypfx.Trace.Dsn.V01'
```

- Detail Trace example

```
REQ=ATRAC DETLABC  DB2PLAN=ABC  TYPE=SQL,SCAN,IO
STORAGE=4000K  WRAP=Y  TITLE='I/O TRACE OF ABC'  GROUPSQL=Y
TRBUFF=5,  TRSIZE=800K
```

- Monitor example

```
REQ=BPUTL BP0  WMAX=85  I=00:01:00  WLIM=99  LOG=ATWARN
```

See sample member BLKDMRKY in BBPARM for a description of all the keywords you can use.

- **To define requests to check active thread exceptions** (“runaway queries”) or other background exception conditions (DMRBEX00 member in BBPARM):

- TSO Exception example

```
MSG=DZ0630W, CPUTOT=1000, GPTOT=100000
```

See sample member DMRBEXBB in BBPARM or “Chapter 3 - Monitors and Exception Detection” in Volume 2 of the *MAINVIEW for DB2 User Guide* for a complete list of all the background monitors.

To display the active background samplers, you can type **BG ON** from the Active Timer Requests application (Option 3).

- **To activate, modify, or purge individual traces**, use the Start Trace panels (ST option from Current Traces (Option 4)).
- **To activate, modify, or purge individual monitors**, use the Start Monitors panels (SM option from Active Timer Requests (Option 3)).
- **To activate a block request with additional monitors or traces manually**, type on any full-screen display:

```
SERV ====> SET
PARM ====> BLK=blkmrname
```

where blkmrname is BLKDMRW or a user-created block request member in BBPARM.

- **To purge all existing requests from BLKDMRW manually**, type on any full-screen display:

```
SERV ====> SET
PARM ====> PRG=BLKDMRWP
```

---

## Chapter 2. Isolating DB2 Performance Problems

These scenarios teach you how to navigate easily through the MAINVIEW for DB2 views and displays and use the available facilities. They do not show you every area covered by the product or all of the displays.

In this practice session, you

1. Check status and activity of all DB2s to detect potential problem areas.
2. Analyze a single DB2 to study problem areas in more detail.
3. Use monitors to isolate specific resource- or workload-related problems.
4. Review critical problems, including those just identified by workload monitors.

See the *Using MAINVIEW* manual for a complete description of how to work in both windows mode and full-screen mode.

**Note:** This practice session takes approximately one hour to complete.

## Enter MAINVIEW

If you are new to MAINVIEW, you should get a copy of the document *MAINVIEW Quick Reference* before starting. This document covers the basic things you need to know to use any MAINVIEW product. It also includes some blank lines that should be filled in with your startup options. See *Using MAINVIEW* for more detailed information.

1. Enter MAINVIEW by executing the MAINVIEW CLIST, selecting an ISPF panel option, or logging on to a VTAM session.
2. Go to Option **0.1.1** to specify your CASID, and then return to the MAINVIEW Selection Menu, as shown in [Figure 1](#).

*Accessing  
MAINVIEW  
for DB2*

```
----- MAINVIEW Selection Menu -----
OPTION  ==>>                                DATE  -- 03/09/26
                                           TIME  -- 10:47:08
                                           USERID -- BMVDID3
                                           MODE  -- ISPF 5.2

      0 Parameters and Options

      U Utilities, Tools, and Messages

Solutions for:
      A Automated Operations
      C CICS
      D DB2
      I IMS
      L Linux
      N Network Management
      S Storage Management
      T Application Management and Performance Tuning
      W WebSphere and MQSeries
      Z OS/390, z/OS, and USS

      Enter X to Terminate

                                Copyright BMC Software, Inc. 2002
```

Figure 1. MAINVIEW Selection Menu

From this menu and its related set of submenus, you can access any installed MAINVIEW product. Products that work together to provide similar solutions are grouped together in submenus. You also have access to a full set of MAINVIEW functions that work with all of your MAINVIEW products to help you solve your performance problems. (See *Using MAINVIEW* for a description of these functions.)

3. To access the DB2 Solutions submenu, shown in [Figure 2 on page 7](#), select option **D** from the MAINVIEW Selection Menu.

### Accessing MAINVIEW for DB2

```

----- DB2 Solutions -----
OPTION ==>
                                DATE  -- 2003/05/08
                                TIME  -- 12:38:32
                                USERID -- B0LLAA2
                                MODE   -- ISPF 5.2

Performance
  1 MVDB2      MAINVIEW for DB2
  2 SPD        System Performance for DB2

Application Management and Operations
  V MVVP      MAINVIEW VistaPoint
  A AUTOMATION MAINVIEW AutoOPERATOR
  E ALERTS    Alert Management

General Services
  M MESSAGES  Messages and Codes
  J JOURNAL   Journal Log
  P PARMS     Parameters and Options

```

Figure 2. DB2 Solutions Submenu

**Note:** If you have the full SmartDBA System Performance for DB2 solution installed, you can use option **2** to access its capabilities.

- To access MAINVIEW for DB2, select option **1** from the DB2 Solutions submenu.

The Parameter Confirmation panel is displayed, as shown in [Figure 3](#).

### Setting Session Parameters

```

BMC Software ----- Parameter Confirmation ----- MAINVIEW for DB2
Command ==>

Confirm parameters for this session of MainView for DB2:

Context ==> ALL      Default context

Screen  ==> MVDB2    Initial screen

Mode    ==> WINDOW   Window/Full/FullScreen (Initial Mode)

Confirm ==> YES      Yes/No (Show this panel at next session startup)

Press Enter to continue or press HELP for additional information.

```

Figure 3. MAINVIEW for DB2 Parameter Confirmation Panel

This panel prompts you to confirm the parameters for your MAINVIEW for DB2 session. The first time you sign on, the default parameters are

- A context of all active DB2 subsystems
- An initial screen of MVDB2, which displays an Easy Menu called EZDSSI
- A primary display mode of MAINVIEW windows mode

You can change the parameters for a session by changing the values on this confirmation panel. You can also change the default parameters for future sessions of MAINVIEW for DB2 by selecting option 0.1.D, Parameters–Windows Mode, on the MAINVIEW Selection Menu.

- To continue with this exercise, change the Mode setting to **FullScreen** and press **Enter** to access the MAINVIEW for DB2 Primary Option Menu, as shown in [Figure 4 on page 8](#).

# Check DB2 Status and Activity

Begin by accessing the MAINVIEW for DB2 Primary Option Menu, as shown in [Figure 4](#).

- Analizers*
- Monitors*
- Traces*
- Thread History*
- Views*
- DB2 Catalog*
- DB2 Console*

```
BMC Software ----- PRIMARY OPTION MENU ----- MAINVIEW for DB2 7.2.0
OPTION ==> v
                                     DATE  -- 9/17/02
                                     TIME  -- 13:45:08
                                     USERID -- CIR11
                                     MODE  -- ISPF 4.2

    Managing DB2 Performance:
      1 STATUS      - DB2 Status (DB2ST)
      2 ANALYZERS   - Current Status/Activity Displays
      3 MONITORS    - Early Warnings/Recent History (Active Timer Requests)
      4 TRACES      - Current Application Traces
      5 HISTORY TRACES - Historical Trace Data Sets
      6 GRAPH       - Recent Thread History
      7 I/O         - DB2 I/O Analysis
      8 BBI INFO    - BBI Subsystem Information
      V VIEWS       - Windows Mode (New Facilities)

    DB2 administration:
      RX RxD2 FlexTools

    General Services:
      C CYCLE SETUP - Service Refresh Cycle Setup
      L LOG DISPLAY - Display Logs
      M MESSAGES    - Display Messages and Codes
      K KEYS        - Current PF Key Assignments
      T TUTORIAL    - Tutorials/News/Getting Started
      X EXIT        - Terminate
                                     PF1/13: HELP
                                     PF3/15: EXIT
```

Figure 4. MAINVIEW for DB2 Primary Option Menu

From here, you have direct access to all facilities provided by MAINVIEW for DB2. Most of the options shown here provide direct access to data displays and control panels for managing a single DB2 at a time. You can change the target DB2 directly on almost every screen. Most of these functions operate in full-screen mode. If you want to access the trace facility quickly (options 3 and 4), this can be a good starting place.

However we are first going to investigate the capabilities of the windows-mode views, since they are specially designed to provide an overview of multiple DB2 subsystems at a time, as well as drill-down to details about any single DB2.

Point-and-shoot *hyperlinks* take you from one view to other displays with related information. Sometimes these displays are further windows-mode views; sometimes they are full-screen displays normally accessed through these menu options.

## Check Status of All DB2s

To access windows mode and get acquainted with the views available for monitoring multiple DB2s at a time:

1. Press **PF3** to return to the DB2 Solutions Menu and choose option **1** again. This time, select **Windows** mode. This mode of entry is preferred because you have quick access to all DB2s.

Or, from the Fullscreen Primary Option Menu, select the **VIEWS** option.

OPTION ==> **V**

The DB2 SSI Easy Menu (EZDSSI) is displayed, as shown in [Figure 5](#).

*Window  
Information  
Line ==>*

                                . Return...

```

Figure 5. DB2 SSI Easy Menu (EZDSSI)

2. Look at the fourth line from the top.

This is the *window information line*. It shows the number of this window (since you may later have several windows open at once), the name of this view (EZDSSI), the current target context (ALL), date, time, and product (MVDB2).

This view is an example of an Easy Menu that provides hyperlinks to various other views.

**Note:** Options prefixed with a period take you directly to data, while options prefixed with a “>” take you to another menu.

This EZDSSI Easy Menu is designed to be used in Single System Image (SSI) mode to look at multiple target DB2s at one time.

3. Several hyperlinks to other Easy Menus can be used to check out DB2 status, for example:

- **Stats Menu** provides options to select the many views that show complete DB2 statistics (EZDSTAT). EZDSTAT hyperlinks generally go to tabular views that show one row per DB2 with detail views accessible from there.
- **Buffer Pool Menu** provides options to show status and statistics for individual buffer pools (and group buffer pools).

Look at these menus but do not go further now. You can come back here later.

4. To check the status of all DB2s, put your cursor on the **SSI Status - List DB2s** hyperlink and press **Enter**.

This link takes you to the STDB2 view, as shown in [Figure 6](#), maintaining the default context of ALL, which includes all defined DB2s.

## Check Status of All DB2s

Figure 6. DB2 Activity Overview (STDB2)

With this view, you can quickly gauge how well each of your DB2 subsystems is performing by reviewing and comparing the number of active threads, key activity rates, a total exception count, and the most critical warning condition that exists right now (if any). Notice the “>” sign before the W1 in the information line. This symbol indicates that you can scroll right for more data.

Later you will see how you can move these fields around and set thresholds to customize the view to meet *your* monitoring needs exactly (or even create different views for different conditions).

5. Several of the column headers are highlighted, indicating that you can choose a row in that column. From each row, you can hyperlink to a view with more detail (related to that column) for the selected DB2.

If you see a warning message for one DB2, place the cursor on that message and press **Enter** to see a list of all the warning conditions that are tracked per DB2. If multiple conditions exist at the same time, only the most important is shown in STDB2, and the others are set to YES in this view. Press **PF3** to return to STDB2.

**Note:** You can do this hyperlink to see the list even if the warning message field is blank (all the conditions will be set to NO).

6. Hyperlink on the **DB2 Target** field for an active DB2 to see a detail status view.

You will return here later. Press **PF3** to return to STDB2.

7. Hyperlink on the **Comm Rate** field for an active DB2 to see counts and rates of activity in that DB2, both for the current interval (1 to 15 minutes) and for the total session data since DB2 startup.

*Interval and  
Session Counts*

```

Figure 7. Activity Rates (STRATE)

Again, some of these fields are highlighted, indicating that hyperlinks will take you to even more detail.

8. Press **PF3** to return to STDB2.

Current Thread Activity

From the DB2 status overview (STDB2), you can access current thread information:

- 1. Hyperlink on **ACTV THRD** to view a list of all active threads in the selected DB2, as shown in [Figure 8](#).

All Active  
Threads

```

17SEP2003 11:59:34 ----- INFORMATION DISPLAY -----
COMMAND ==>
CURR WIN ==> 1          ALT WIN ==>

```

Figure 9. Detail User Status Display (DUSER)—Base Section

Expand to  
SQL Detail =>

SQL Statement

This display shows all available accounting detail information about that thread. The most critical data is summarized in the base section, including key indicators of failures or potential problems. You can scroll down, use the expand buttons, or point-and-shoot to view complete detail data. Also, the DB2 thread cancel command can be invoked with a CANCEL parameter if you have the proper authorization.

4. The full text of the current SQL statement being executed is available near the bottom of this base section.

If your window size is too small to show the full text, position the cursor on the first text line and scroll down with **PF8**.

Notice that this section also includes the current package/DBRM name, the amount of time this SQL statement has been active, and the last page accessed.

5. Tab to the **SQLCOUNTS** button or to the **TOTAL SQL** line and press **Enter** to view a breakdown of all SQL executed by this thread.
6. Press **PF3** once to return to the DUSER base section.
7. If this is an active IMS or CICS thread and if MAINVIEW for IMS or MAINVIEW for CICS is installed, the detail display will include an expand button to expand directly to that product:
  - MAINVIEW for CICS: TASKXPND display for this CICS transaction
  - MAINVIEW for IMS: DREGN display for the region processing this IMS transaction

Press **PF3** once to return to DUSER.

8. There are many other sections of detail data with which you will get acquainted over time. For example, if you are concerned about locking, you could choose the **LOCKE** expand button to see all the locks held (or waited on!) by this thread and any threads in contention with it.
9. Press **PF3** again to return to THDACTV. There are several other hyperlinks that can be useful in analyzing a thread:
  - **%CPU** is highlighted if APPTUNE is installed. You can then hyperlink on this column to immediately access the detailed SQL statement activity collected for the plan of the selected thread.
  - Hyperlink on **User Status** to see a subset of the DUSER information in THDDETL. Staying in windows mode may be valuable if you need to “freeze” the threads to look at several at the same point in time.
  - Hyperlink on **Activity** when it shows a currently active SQL statement. This hyperlink takes you to the Data Collector Explain, which includes Plan\_Table information, catalog object data, and SQL recommendations.
10. Press **PF3** several times to return to EZDSSI.

Exceptions Overview

Another way to check for exception conditions in any of your DB2s quickly is to choose the **Exceptions** hyperlink on EZDSSI to bring up the view STEXC, as shown in [Figure 10](#).

Exception  
Conditions

```

17SEP2003 16:52:20 ----- INFORMATION DISPLAY -----
COMMAND ==>
CURR WIN ==> 1          ALT WIN ==>
W1 =STEXC===== (ALL=====*) 17SEP2003==16:50:58====MVDB2====D====4
DB2      Warning  System      User
Target   Monitors  Exceptions  Exceptions  Warning  Msg
DB1GC    0         0          0          0      Connect Fail
DB1HC    0         0          0          0      GBL cont >2%
DB2GC    0         0          0          0      Connect Fail
DB2HC    1         0          0          0      GBL cont >2%

```

Figure 10. Exception Conditions (STEXC)

This view identifies immediately whether or not any exceptions have been detected, and shows what kind they are. Hyperlinks lead to additional details.

**Warning Monitors** show conditions that have been detected by timer-driven sampling monitors defined with warning thresholds. Typically, a predefined group of monitors is started automatically and it is always active. A later section provides more information on monitors.

**System Exceptions** are conditions that are detected by a background sampler and are not governed by a threshold; for example, a problem with log archiving.

**User Exceptions** are thread-related conditions detected by a background sampler. Threshold conditions can be defined per attach type; for example, IMS, CICS, or batch.

The first three types generate warning messages that can be viewed while active, tracked historically in the journal log, or fed into an automated operator product like MAINVIEW AutoOPERATOR.

**Warning Msg** shows the most important of several conditions that are checked per interval, and on request, as part of the total DB2 status and statistics data collection for windows-mode views. These conditions may also be identified by one of the other exception samplers.

- 1. If you have a non-zero value for any of these counts, follow the hyperlinks to see further details.
- 2. When finished, press **PF3** as needed to return to EZDSSI.

Thread Activity for Multiple DB2s

From EZDSSI, you can choose hyperlinks to view thread activity across multiple DB2s:

- 1. Hyperlink on **Current Threads** to see all active threads, identified by the DB2 they are running in.
- 2. Hyperlink on **Summary by DB2** to see a summary of threads for each DB2; then hyperlink on **one row** to view a list of threads for just that DB2.

## Analyze One DB2

Two ways are available to drill down to a specific DB2. For the purposes of this exercise, use the second method:

- Select any view from the DB2 SSI Easy Menu (EZDSSI). From the list of available DB2 targets, you can hyperlink to another view with more information about the selected DB2.
- From EZDSSI, choose the **Easy Menu** hyperlink to access an Easy Menu designed to analyze one DB2 at a time, EZDB2, as shown in [Figure 11](#). This method selects one DB2 from the context of ALL. (If you choose the **SSI Status** hyperlink, the STDB2 view provides a drill down on the target to STDB2D, and from there to EZDB2.)

                                . Return...

```

Figure 11. DB2 Easy Menu (EZDB2)

To select the target DB2 you want to analyze:

1. Hyperlink on **Set Target Context** to see a list of targets; then place your cursor in the **Target** column and press **Enter** to hyperlink to a different target.

**Note:** If you already know the DB2 target you want, simply type **CON target** on the COMMAND line.

2. Notice in the **Tools And Menus** section, there are hyperlinks to several other Easy Menus.

Check DB2 Status

To check the status of the target DB2:

- 1. Hyperlink on **DB2 Status Summary**.

This link takes you to the STDB2 view, as shown in [Figure 6 on page 10](#), but only the one DB2 is displayed.

- 2. Now you may want to review recent history.

Type **TIME \* \* 2H** to see the last 2 hours by 15-minute intervals. Type **INCLUDE TIME** to see the times (the Intvl Time column is added to the view), as shown in [Figure 12](#).

*Review  
History*

Figure 13. DB2 Status Detail—Interval (STDB2D)

This view shows an overview of current thread activity per attach type as well as key indicators of recent performance. There are several hyperlinks at the top of the view, in addition to hyperlinks to threads of different connect types in the middle of the view, and others in the key indicators shown at the bottom of the view.

5. Use the **.STDB2DS** hyperlink at the top of the view to see totals since DB2 startup instead of current interval values in the key indicator fields.
6. The **>EZDSTATD** option takes you to the DB2 Stats Detail Easy Menu.

This Easy Menu is very similar to the DB2 Status Easy Menu, EZDSTAT, that you saw earlier, but the hyperlinks here take you directly to all the detailed statistics views for this DB2.

7. Hyperlink on **SQL Counts** to see STSQLD as an example of these detailed statistics views, as shown in [Figure 14 on page 18](#).

```

Figure 14. SQL Counts Detail (STSQLD)

8. Press **PF3** to return to EZDSTATD.
- You may want to browse a few other detail views.
9. Press **PF3** to return to STDB2D.
10. Hyperlink on **TSO** to see a tabular view of current TSO users.
11. We have stepped through several status views now. However, some information is not available in windows mode. Examples are information about CICS connections, DB2 logging, DSNZPARM values, and so forth.
- To access these displays, simply press **PF3** to return to the Primary Option Menu, or you can use one of the following quick paths:
- From EZDB2, choose **FullScreen Menu** to hyperlink into full-screen mode.
  - Use the transfer command at any point to access the full-screen DB2 Status display DB2ST. This is similar to STDB2D, but it provides point-and-shoot to most full-screen displays, such as CICSC (to see CICS connections), ZPARM, and so forth.
- TRANSFER target DB2;EX DB2ST**
- You can also use the transfer command to access other MAINVIEW products.
12. Return to EZDB2 and choose **Exception Menu**.
- Besides access to the exception displays that you’ve seen before, the Exception Menu also has a hyperlink to the MAINVIEW ALERTS view. This view consolidates monitor exceptions and those produced by alarms defined in MV ALARM. There are also hyperlinks to the Alerts Menu and to MV ALARM.
13. Press **PF3** to return to EZDB2 again.

## DB2 Topic Index Access

Instead of always using the menu navigation, you can quickly find the views you want through topic index views.

1. In EZDB2, hyperlink on **DB2 Topic Index** to access the DB2 Topic Index menu. This menu provides alphabetic access to the defined topics.
2. Press **PF3** to return to EZDB2.
3. Think of a DB2 performance issue you might want to investigate. For this walkthrough, let's choose "data set open/close activity". For the quickest access, you can now type **TOPICD** on the COMMAND line to access a list of DB2 topics starting with the letter D, as shown in Figure 15. (This can be done in any MVDB2 view.)

*Quickly Find  
Information  
about DB2  
Topics*

. Link to next page

Figure 15. DB2 Topic Index View

4. Now browse through the list of topics starting with the letter, D, until you find **Data Sets**. There are several entries under this topic, including several for open/close activity.
5. The first hyperlink column is usually the one you want to take when looking at a single DB2, but you can also access similar SSI views, related monitors and ZPARMs, and identify relevant trace data.
6. Hyperlink on **STDSAD** to see the view of that name. It will show you the statistics you want to see.

Buffer Pools

To analyze buffer pools for the target DB2:

- 1. From EZDB2, hyperlink on **Buffer Pools** to see a list of all defined pools with allocated space, utilization, and getpage rates, as shown in [Figure 16](#).

*All Defined  
Pools*

```

17SEP2003 17:04:18 ----- INFORMATION DISPLAY -----

Figure 18. Buffer Pool Rates Detail (BFRPLHD)

5. Press **PF3** to return to EZDB2.

Group buffer pools are discussed later in the data sharing section (see [“Tune Group Buffer Pools” on page 61](#)).

## Catalog Access

MVDB2 also provides a catalog browse facility with hyperlinks to the CATALOG MANAGER product. If you are licensed for the full product, all of its functions are available directly from MVDB2.

1. From EZDB2, hyperlink on **CATALOG MANAGER Browse** to access the Catalog Browser Primary Menu, as shown in [Figure 19](#).

*Look at  
Catalog  
Objects*

```
DB2K- ----- Catalog Browser 7.2.01 Primary Menu -----
Command ==>

Enter object type and qualifier for an object list

Object type . . .
                DB Database   TS Tablespace   PL Plan       ST Strings
                SG Stogroup   SU SysPrivUser AL Alias      L0 Locations
                TB Table      SY Synonym    US User       CK CheckConst
                VW View       PG Package    CO Column     PR Procedures

                as an unpublished licensed work.
                All rights reserved.
```

Figure 19. Catalog Browser Primary Menu

This menu allows you to browse most catalog objects.

2. Press **PF1** for help to see a complete list of objects.
3. Tab to the **object type** selections and type **DB** to see a list of data bases.
4. You now see the object list display of all data bases. Enter a line command of either **S** or **D** next to one data base to see the complete catalog row data for that data base.
5. Press **PF3** to return to the database list. Now enter the **TS** line command to see a list of all the table spaces in the selected database.
6. For help on available actions, type **COMMAND**. For help on a message you received, type **TSO BMCMSGmsgid**.

## Lock Contention Analysis

Although locking problems must usually be resolved at the application level, the first indication of problems—and the simplest identification of the applications and resources involved—can best be seen at the system level. To use the options in the Lockouts section of EZDB2 to look at locking problems in one DB2 (without data sharing):

1. If you aren't sure whether or not you are having much lock contention, you may want to review the lockout and suspension counts and rates first in the STRATE view (hyperlink on **Activity Rates**).

A certain number of lock suspensions (and even an occasional timeout or deadlock) is to be expected in an active DB2 system. More frequent lockout conditions (either timeouts or deadlocks) may be a cause for concern, since the SQL statements involved are terminated.

2. You can hyperlink to see a list of the last 100 timeouts and deadlocks either from the **Lockouts** field in STRATE, or from **Lockout Events** on EZDB2.

Both go to the view LKEVENT, as shown in [Figure 20](#).

### Timeouts and Deadlocks

```

17SEP2003 17:20:11 ----- INFORMATION DISPLAY -----
COMMAND ==>
CURR WIN ==> 1          ALT WIN ==>
>W1 =LKEVENT=====DB2HC====*=====17SEP2003==17:20:10====MVDB2====D====5
Date / Time   Lockout  Victim  Victim  Victim  Victim  Victim  Nr.
----- Type    Plan    AuthID  Connect CType  Corr ID  Res.
17SEP-16:58:56 DEADLOCK  AUDIT   BBLLAT5 TSO     TSO     BBLLAT5  2
17SEP-16:58:45 TIMEOUT  PAYROLL DMRDLK3 BATCH   BATCH   DMRDLK3  1
17SEP-16:42:34 TIMEOUT  PAYROLL DMRTM03 BATCH   BATCH   DMRTM03  1
17SEP-16:37:33 DEADLOCK  AUDIT   BBLLAT5 TSO     TSO     BBLLAT5  2
17SEP-16:36:53 TIMEOUT  RXDB2   AXCNM11 DB2CALL CAF     AXCNM11  1

```

Figure 20. Lockout Events (LKEVENT)

This view shows a chronological list of up to 100 lockout events that have occurred since DB2 startup, sorted with the most current at the top of the screen.

3. Type **sort** and tab to the **Victim Plan** column to sort these lockout events by plan name to identify the applications for which SQL requests were terminated.
4. Hyperlink on the **Date/Time** field for an event (preferably a deadlock that involves multiple resources).

The first view shows the resources involved and holder (blocker) and waiter plans.

5. Scroll right to see additional details for both resources at once, or hyperlink on the **Res Seq** field to see all the available details for this conflict.
6. Press **PF3** to return to EZDB2.

Although you may have analyzed lockout conditions one at a time like this before, the windows-mode views provide additional analysis capabilities. They are available through the other three hyperlinks in the lockouts section of EZDB2.

7. Hyperlink on **Resource Summary** to do an analysis of the resources involved in timeouts or deadlocks, as shown in [Figure 21](#).

*Resources  
Involved*

```
17SEP2003 17:21:09 ----- INFORMATION DISPLAY -----
COMMAND ==>
CURR WIN ==> 1          ALT WIN ==>
>W1 =LKRESZ=====DB2HC=====17SEP2003==17:21:09====MVDB2====D====2
--Resource Name--  Total      % Total      Global
Database Object  Conflicts  0...50...100  PAGE  ROW INDEX Conflicts
DSN8D51A DSN8S51E      5  71.4  *****      5    0    0      2
DSN8D51A DSN8S51P      2  28.6  ***          0    2    0      2
```

Figure 21. Lockout Resource Summary (LKRESZ)

The first view, LKRESZ, summarizes all conflicts by resource name, usually database and table space. Note that a deadlock with three resources and participants will result in three conflicts, not one, for the purposes of this analysis. With this view, you can easily identify those table spaces involved in the most contention.

8. Hyperlink on a **resource name** showing one or more conflicts to see a breakdown of these conflicts by specific resource, down to a page or row level (LKRESNRZ).

With this view, hot spots in your tables are immediately visible, as shown in [Figure 22](#).

*See Hot Spots  
in Tables*

```
17SEP2003 17:22:35 ----- INFORMATION DISPLAY -----

Database Object  Number  Type      Conflicts  0...50...100 Conflicts
DSN8D51A DSN8S51E 0000001200 DATAPAGE      5  71.4  *****      2
```

Figure 22. Lockout Resource Number Summary (LKRESNRZ)

9. Hyperlink on either the **resource name** or the **resource number** to view a list of each lockout event that involved this resource (LKRESD), as shown in [Figure 23](#).

The events are initially sorted in descending sequence by time, but the SORT command can be used to sort by any column. (If you have forgotten how, type **HELP SORT** on the COMMAND line.) This allows you to identify the applications (blocker planname, waiter planname) and users (blocker/waiter Corr ID, Connection, Victim Auth ID) involved quickly.

*Each Event for  
This Resource*

```
17SEP2003 17:24:34 ----- INFORMATION DISPLAY -----
COMMAND ==>

RXDB2    RXDB2          1         0      20.0 ***             0          0

```

Figure 25. Lockout Blocker/Waiter Summary (LKBWZ)

The view LKBWZ summarizes the conflict data by blocker and waiter plans, so that you can quickly see which applications are causing the most conflicts. The hyperlinks again show all of the lockout events where the selected plan was involved.

12. Press **PF3** until you return to EZDB2.
13. To see current contention, hyperlink to the **Fast Menu** (on the right under Tools And Menus).

In the Lock Activity section, there are two valuable options:

- Hyperlink on **User Contention** to see a list of active threads with lock counts (LOCKU). Holding and waiting threads in current conflicts are identified.
- Hyperlink on **DB/TS Contention** to see a list of resources in contention, showing the lock owner and waiters (LOCKD).

From both of these displays, you can hyperlink on one conflict to see additional details. The LOCKE display shows a thread with all locked resources and identifies waiter threads per resource.

**Note:** LOCKU is also accessible through hyperlinks in several thread views (THDxxx).

Page Set Status and I/O Analysis

The tuning of physical I/O and page set usage in the buffer pools is a critical success factor in DB2. DB2 itself uses many techniques to reduce or defer I/O, but the setup, from DASD volumes to buffer pool allocation and thresholds, all plays a part.

- 1. To look at data object issues with the focus still on a single DB2, begin by accessing the DB2 Page Set Easy Menu, **EZDPS**, as shown in [Figure 26](#).

**Note:** MVDB2 collects these page set statistics with low overhead from DB2 control blocks.

Access  
Page Set  
Information

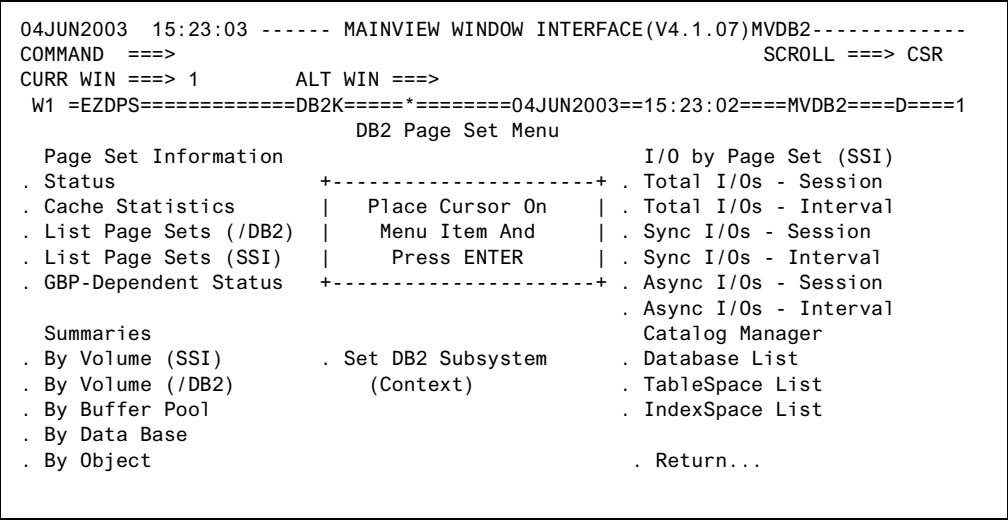

Figure 26. Page Set Easy Menu (EZDPS)

2. The first thing to review is simply the status of all open page sets. Hyperlink on **Page Set Status** to see a list sorted by object name (database, table space, partition), as shown in [Figure 27](#).

*Sort by  
Object Name*

```

```

Figure 27. Page Set Status (PSSTAT)

3. Sort on the **EXT** column to identify the data sets with the highest number of extents (a potential performance impact). Type **sort d** and tab to the **EXT** column.

4. If you want to limit the view by selecting only certain page sets, one simple way is to use the **WHERE** command. It works very much like the SQL **WHERE** clause. First choose one (or more) column you want to filter the view on. Place the cursor in that column header and press **PF1** to view the field help. Within the help, the element name is identified.

Now type **WHERE** on the **COMMAND** line. Under Where Condition, type the filters you want in effect.

For example, to show only those data sets with several extents, type

**IO\_EXT > 5**

Press **PF3** to return to PSSTAT with the **WHERE** clause in effect. You can check the filters in effect in any view with the **SHOWFILT** command.

**Note:** Help for any command is available by typing **HELP commandname** on the **COMMAND** line.

As another example of filtering, to see only catalog tables, type

**IO\_DBTSP = DSNDB06\***

5. Hyperlink on the **Page Set** field to see complete details about the selected page set, including size, volume, buffer pool cache data, and detailed I/O counts and elapsed wait times. You may need to scroll down with **PF8** to see all the data.
6. Press **PF3** to return to PSSTAT.
- Hyperlink on the **Users** column to see the threads currently accessing this page set. Or hyperlink on the **ERR** column to see if a restricted status is in effect for this table space.
7. Press **PF3** to return to EZDB2.
8. One of the most important issues to check periodically is data set placement and volume I/O response times.

Hyperlink on **Volume I/O Summary** to see the volumes in use for DB2 databases, as shown in [Figure 28](#).

*Volumes  
In Use*

```

BAB330 DB2H	1	3	0.7		40	20	*****		1

Figure 28. Volume I/O Summary—Session (PSVOLSZ)

9. Type **SORT D** and tab to **Sync Avg I/O Wait** to sort the volumes with the highest average delays to the top.

10. These values are based on activity since DB2 startup.

To see a 2-hour summary of activity for one volume broken down into 15-minute intervals, hyperlink on **Sync I/Os**.

Press **PF3** to return.

11. Hyperlink on a **volume** to see a list of all page sets on that volume.

You may want to scroll to the right to see the asynchronous I/Os made for prefetch, since these I/Os have different access characteristics and delay times than do synchronous I/Os.

12. Press **PF3** until you return to EZDB2 and hyperlink on the **Page Set Menu** option to go to EZDPS.

Hyperlink on any of the **I/O by Page Set** options to look at I/O counts and wait times per page set.

- Sort on the **Avg I/O Wait** column to identify the highest average delays that can point out DASD response time problems.
- Sort on **Max I/O Wait** to help identify occasional contention problems that are masked in the averages.

**Note:** However, be aware that the maximum is since DB2 startup, not per interval. This does reduce its usefulness.

13. Press **PF3** until you return to EZDPS and hyperlink on **Cache Statistics** to analyze page usage in the buffer pools and hiperpools by page set, as shown in [Figure 29](#).

### Cache Statistics

```

Figure 30. Buffer Pool Page Set Summary—Session (PSBPSZ)

The view PSBPSZ gives you a quick overview of how all the buffer pools are being used.

15. Hyperlink on Bfrp1 ID to see a list of all page sets allocated to that pool (PSBPS). Sort on the VP Current column (descending) to sort those with the highest current storage usage to the top.

The VP Changed and VP Max Chng columns identify those page sets with update activity.

16. Press **PF3** until you return to PSBPSZ. Hyperlink on **VP Current** for a 2-hour history.
17. Press **PF3** until you return to EZDB2.

## Use Monitors to Isolate Problems

Monitors sample key measurements over time and save short-term history. When thresholds are specified, the measured values are compared and automatic warnings generated.

A default set of monitors defined in BBPARM member BLKDMRW is automatically started. This set can be tailored for each DB2 system with different monitors or different thresholds.

To view the active monitors:

1. From the Primary Option Menu, select the **MONITORS** option.

```
OPTION ==> 3          (Active Timer Requests)
```

All **active** monitors are listed here. The current measurement values are shown and plotted compared to the thresholds. The W in the middle marks the warning threshold values. All monitors with acceptable values remain on the left side of the W. Those in warning status extend to the right and are highlighted, as shown in [Figure 31](#).

**Warning  
Status**

Figure 31. Active Timer Requests Application

2. Type **x ON** on the COMMAND line to view only those monitors in exception status.

We'll investigate exceptions more thoroughly later.

3. To find out how to start a monitor (and generate an exception to view):

```
COMMAND ==> SM          (Start Monitor)
```

This application displays a list of all available monitor services. (SM is an **application transfer** command that saves your current position and transfers you to another application. You can type a transfer command in any COMMAND line or SERV field.)

Start a Monitor

Monitors look at either resources/system activity (resource monitors) or at workload activity (workload monitors). One workload monitor can be started multiple times to look at different workloads to help isolate specific workload-related problems. Some resource monitors also have parameters to support multiple requests—for example, buffer pool number.

There are many available monitors. You can scroll through the list with PF7/8, sort on any of the columns, or select only those monitors for the area in which you are interested.

To practice starting a monitor:

- 1. Type **AREA WKLD** on the COMMAND line.  
All workload monitor names start with # (for a count) or with an @ (for an average).
- 2. Type **s** in the line command column next to #SQLM to select a workload monitor.  
By selecting #SQLM, you can view some immediate activity because this service measures the number of DML statements issued.  
This takes you to the data entry panel, as shown in [Figure 32](#).

Using Defaults

BMC Software ----- START DB2 WORKLOAD MONITOR REQUEST --- PERFORMANCE MGMT  
COMMAND ==> TGT ==> DB2G

#SQLM - DATA MANIPULATIVE SQL

PARAM	==>	(Workload Monitor Identifier)
INTERVAL	==> 00:01:00	START ==> STOP ==> QIS ==> YES
WVAL	==>	WMSG ==> WLIM ==> 10 WIF ==> 1 WIN ==> 1
TITLE	==>	(Title)
RST	==> HOT	(Restart Option: HOT,COLD,PUR,QIS)
PLOTMAX	==>	(Maximum PLOT X-Axis Value)
RANGES	==>	(1-4 Range Distr. Upper Limits)
LOG	==>	(NO,ATSTOP,ATPD,ATINTVL,ATWARN)
Specify Selection Criteria:		
ICHECK	==> NO	(Check elapsed versus Interval time)

DB2PLAN	==>	
DB2AUTH	==>	
DB2CONN	==>	
DB2CORR	==>	
DB2LOC	==>	

Figure 32. Start DB2 Workload Monitor Data Entry Panel

3. Define optional workload monitor data collection parameters on the data entry panel using mostly defaults.

a. `PARM ==> id`

You can specify any name as an ID if you want several requests for this monitor to look at different workloads.

b. `INTERVAL ==>`

Use the default (00:01:00) of one minute data collection intervals.

c. `START ==>`

Use the default to start at the next even minute, or type a future time in the format of hh:mm:ss.

**Note:** The monitors are synchronized to the even minute to make it easier for you to compare the history values they collect.

d. `STOP ==>`

Use the default of no stop time, or type a time at which you want the monitor to stop in the format of hh:mm:ss, or the number of intervals (minutes).

e. `WVAL ==> warning threshold value`      Maximum (n) or Minimum (<n)

A warning message is issued automatically when a sampling exceeds the monitor threshold. Type a low value so you can see a warning. For example, if you expect 100 statements in a minute, type 50. It can be changed to a more appropriate value later.

f. `WMSG ==>`

If left blank, a warning message is sent to the Journal log when sampling exceeds the monitor threshold (also triggers AutoOPERATOR EXECs). Current warnings are shown on DB2EX. Specify `WTO` to also send a message to the MVS console, or a `TSO id` to send a message to that user.

g. Optional fields: (For this exercise, accept the defaults)

WLIM	Limit number of warnings sent
WIF	Wait n intervals before issuing a warning
WIN	Wait n intervals before sending nth warning
RST	Monitor reaction if DB2 stops and is restarted
PLOTMAX	Specifies maximum value of X Axis on monitor plot display
RANGES	Limits for range distribution statistics on plot display
LOG	A hardcopy plot is recorded in the BBI-SS PAS Image log

4. Specify workload selection criteria.

`DB2CONN ==> name, name, name`

Optional. Type one or more names, where name can be TSO, BATCH, DB2CALL, an IMSID, or a CICS jobname. Leave blank for total workload.

5. Press **Enter** to start the monitor and return to the list of monitors.

6. Access the Active Timer Requests (AT) display to make more requests.

`COMMAND==> AT`      (transfer to Option 3 - MONITORS)  
or      `====> =3`      (a quick jump without saving a return path)

7. Type **R** in the line command column next to an active workload monitor to replicate an active monitor request.

This replicates the request parameters.

8. Make another request by typing a unique ID in the PARM field and specifying different selection criteria. Press **PF1** (HELP) for an explanation of the values that can be specified, as shown in [Figure 33](#).

### Getting Help

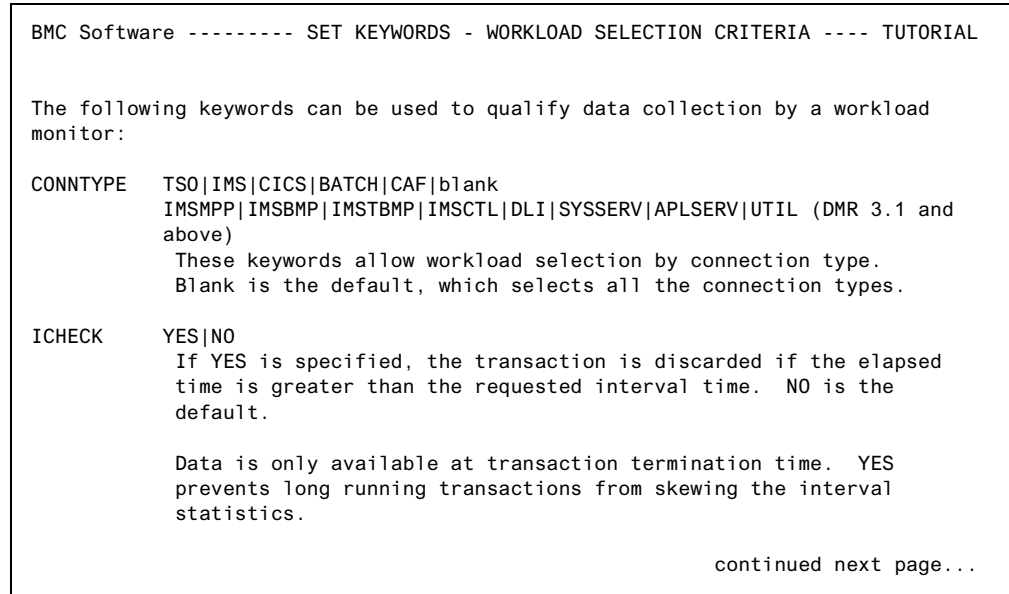

Figure 33. Sample Help Panel

9. Press **Enter** to start the monitor and return to Active Timer Requests.
10. Move the cursor to the COMMAND line and continue to press **Enter** until the new monitors show an ACTIVE status and current measurement values. (Remember, they were synchronized to start at an even minute.)
11. Check that at least one monitor is in warning status (line highlighted).
12. Use the Modify line command to view the monitor options in effect and to modify any that are preceded by an arrow.

```

LC      (Line Command)
M       (for Modify)
  
```

Choose an active monitor and change its threshold value.

```

WVAL ==> n      (Maximum)
WVAL ==> <n     (Minimum)
  
```

If you did not start this monitor, you need special authorization to modify or purge it.

13. Press **PF3** to return to the AT panel.

Look at how the graph of the current value compared to the new threshold has changed.

**Note:** To stop a monitor, use the **Z** line command.

You now know how to start and modify monitors. The next dialog shows you how to look at the data.

---

## Review Critical Problems

To review critical problems, including those just identified by monitors, return to the **DB2EX** analyzer service.

- Type

```
OPTION ===> 2          (from the Primary Option Menu)
COMMAND ===> AN        (transfer to ANALYZERS)
or    ===> =2          (jump to Option 2)
```

Then type **s** in the line command column next to the DB2EX service.

- An even quicker way, if you remember the name of the display you want, is

```
COMMAND ===> EXEC DB2EX
```

**Note:** If you want a display with one or more parameters, type  
**EXEC serv parm1,parm2** on the COMMAND line.  
 For example: **EXEC BFRPL BP0**.

- In a service display, just overwrite **SERV ===> DB2EX**  
 and clear any PARM values.

**Note:** To print any display while you are looking at it, use **PF4** for screen print. To print a series of displays while you are viewing them, specify **LOG=Y** in line 2.

# Exceptions

To review the information on the exception panel:

- 1. Move the cursor to a message and press **Enter**.  
A detailed explanation of the message is shown by the MESSAGES general service.
- 2. Press **PF3** to return to the DB2EX display.  
The exception display lists the time the exception occurred and the severity (S for severe, W for warning, I for informational, M for monitor messages). You can enter the severity code in the PARM field to select the messages for display by severity level, as shown in [Figure 34](#).

*Severe  
Messages*

BMC Software -----			DB2 EXCEPTIONS		-----PERFORMANCE MGMT		
SERV ==> DB2EX			RUNNING 11:25:05 INTVL => 3			LOG => N TGT ==> DB2G	
PARM ==> s			EXCEPTIONS DISPLAYED 1 - 10 of 10			SCROLL=> CSR	
EXPAND: MON(DSYS), LINESEL(MSG)							
TIME	LEV	MSGNO	EXCEPTION				
11:24:00	s	DZ1090S	FINAL ACTIVE LOG DATASET 75% FULL				
11:24:00	s	DZ1110S	BSDS REDUCED TO SINGLE MODE				
11:23:00	s	DZ1020S	IMS TASK(S) QUEUED FOR THREAD(S)				
11:20:00	s	DZ1050S	BP(0) DM CRITICAL THRESHOLD REACHED				

Figure 34. DB2 Exceptions Panel

**Note:** You have already learned how to change monitor thresholds. The background exception messages (S, W, I) are user-modifiable for each DB2 system independently in BBPARM member DMRBEX00. This is also where you specify thresholds for runaway query exceptions per connection type (TSO, CICS, and so on). These exceptions can be triggered based on CPU percent, GETPAGEs, CPU total, elapsed time, or updates per commit.

## More Detailed Information

To view more detailed information:

1. If you are interested in one specific area, such as buffer pools, you can narrow down the display to show only the related monitors.

```
COMMAND ====> AREA BUFR      (enter AREA alone to see them all again)
```

This makes it easier to concentrate on just the buffer information; for example, to compare the GETPAGE REQUESTS to READ I/O and PREFETCH READ I/O.

2. If you don't see the data you want, you can use the same technique to review the other available monitors for buffer pool information.

```
COMMAND ====> SM              (Option 2 - START MONITORS, with stacking)
```

```
COMMAND =>    AREA BUFR
```

You could start additional buffer pool monitors now, just the way you did for #SQLM.

3. Press **PF3** to return to the list of active monitors.
4. Use the Select line command to view the history collected by a monitor.

```
LC   (Line Command)
S    (for Select)
```

Choose an active monitor that is showing non-zero for the current value. If the DB2 you are monitoring is very active, there should be several, including the #SQLM monitor you just started. If not, choose one of the MVS-related monitors such as CSAP, CSA Percent Utilization.

This standard **PLOT** display, shown in [Figure 36](#), is used to show the latest 10 values measured by any monitor. For further trending information, the averages for the total monitoring period and the last 2 periods (10 samples each) are also shown. The threshold value is indicated with a W in the graph. Note the **MAXimum** value ever measured and the time it occurred (MAX AT). Rate per second calculations (in this example, paging rates) are shown at the right.

*Rates/Second**Maximum  
Value*

Figure 36. Sample PLOT Display

5. Press **PF3** to return to the list of active monitors.

6. Restrict the display to monitor exceptions only.

COMMAND ==> **X ON**

7. Press **PF6** to start automatic refresh mode, or type

COMMAND ==> **GO**

Check to see that the word **INPUT** on line 3 has been replaced by **RUNNING**.

You can start automatic refresh whenever you want to watch for problems or events without continually pressing **Enter**.

8. Press **ATTN** to stop refresh and enable command entry.

9. Return to the full display.

COMMAND ==> **X OFF**

10. Change to some other installed MAINVIEW product.

COMMAND ==> **product name**

IMS, CICS, DB2, AO, CAO, IAO, and MAO are valid names.

This saves your current place and presents the Primary Option Menu of that product. You can even stack copies of MAINVIEW for DB2 by typing **DB2**. This can be useful when you must look at another system or product (for example, to answer a user question about production), but you don't want to lose your place.

11. Return to your original place (Active Timer Requests).

COMMAND ==> **=X**

You can also press **PF3** in the stacked environment until you exit from its Primary Option Menu.

Windows-Mode Monitor Views

All of the monitor data you have just seen in full-screen displays is also available in windows mode. Both the EZDB2 and EZDSSI Easy Menus have several hyperlinks to monitor views, as shown in [Figure 37](#).

Figure 40. Monitor Summary by Area (DMAREAZ)

The hyperlinks provide a list of the monitors.

6. Press **PF3** to return to EZDSSI.
7. Hyperlink on **Monitors—Active** to see a summary of active monitors per target DB2.

Additional views are available to show the monitor data from a realtime (DMONR) or session (DMONS) perspective, while DMONC shows all time perspectives in one view.

8. Press **PF3** to return to EZDSSI.

Workload Objective Views

Special workload monitors are started automatically for you to provide service-level monitoring of response time per workload.

Several default workloads have been predefined for transaction and query connections to DB2, based on connection type. Please refer to Volume 1 of the *MAINVIEW for DB2 User Guide* if you want to add workloads or modify the response time objectives of the existing workloads.

To see if you are meeting your response time goals for the defined workloads:

- 1. From EZDSSI, hyperlink on **Monitors—Workload Objectives** to review workload objectives, as shown in [Figure 41](#).

Are You  
Meeting  
Your Goals?

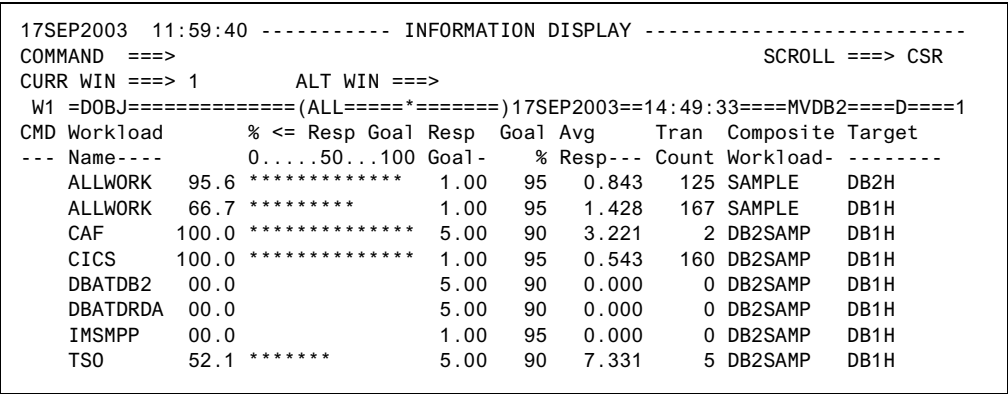

Figure 41. Objectives Review (DOBJ)

The graph shows what percentage of all threads in that workload have met the response time goal.

## Audit Trail

To view an audit trail of problems throughout the day:

1. When in fullscreen mode, transfer to the Log Display general service (Option L).

COMMAND ==> LOG

Or press **PF5**.

When in windows mode, enter

COMMAND ==> TRAN db2target DB2;LOG

All **MAINVIEW for DB2 messages** are shown chronologically, as shown in [Figure 42](#).

*Look for  
Problems*

13:58:12 CONNECTION-ID=DB2CALL CORRELATION-ID=LGS11

```

Figure 42. Sample Log Display

You also can request an online audit trail of all **DB2 system messages** by specifying LOG=YES per target DB2 in the DMRBEX00 member of the BBPARM data set.

2. Check for exceptions that occurred in a specific period (Locate Time).

COMMAND ==> T 1130

3. FIND a specific problem (and press **PF5** for RFIND). For example:

```

COMMAND ==> FIND DW0200W (#SQLM monitor warning)
COMMAND ==> FIND DSNT375 (DB2 deadlock messages)
COMMAND ==> FIND DZ0630W (Runaway TSO query)
COMMAND ==> FIND RUNAWAY (Runaway thread from any connection)
COMMAND ==> FIND DW0 (All workload monitor warnings)

```

- 4. Scroll to the left with **PF10** to see the origin of the messages.  
This value can be used to select a subset of the messages in the Journal log.
- 5. Type **PROFILE** on the COMMAND line to access the Enhanced Journal Facility, as shown in [Figure 43](#).

Select  
Messages  
from  
One Target

BMC Software ----- Log Display ----- General services  
COMMAND ===>  

Included Origins	Excluded Origins	Date --- 02/09/16
DB2G_____	_____	Time --- 12:41:32
_____	_____	
_____	_____	
_____	_____	
_____	_____	

Press END to SAVE Profile and return to application  
CANCEL to discard changes

- Figure 43. Enhanced Journal Facility
- 6. Type your **DB2 target name** (see the TGT field) in the Included Origins column. Return to the Log Display to view the messages only from that DB2.  
  
To also include DB2 messages, specify the target name followed by a plus sign (+), such as **DB2G+**. This specification selects messages from the DB2 address spaces, such as DB2GMSTR.
  - 7. Issue the **PROFILE** command again and specify **&TARGET** in the Included Origins column to automatically select the messages from the current target DB2 subsystem. Also specify the **BBI-SS PAS id** to include MAINVIEW for DB2 messages.

## Issue DB2 Commands

If you have the proper authorization in MAINVIEW for DB2 (this is not DB2 authorization), you also can issue DB2 commands from the fullscreen COMMAND line (usually from the Log Display so you can see the response):

1. Submit a DISPLAY THREAD command.

```
COMMAND ==> -DIS THD(*)
```

The command is automatically routed to the DB2 system shown in the target field. You do not need to know the subsystem recognition character (SSRC) for each DB2.

The command response is shown in [Figure 44](#).

**DISPLAY  
THREAD  
Command  
Response**

Figure 44. Log Display

## View All DB2 Commands

The MAINVIEW for DB2 – Data Collector provides a chronological log of DB2 commands. To view all the DB2 commands that have been issued since DB2 started:

1. From the EZDB2 Easy Menu, select the **DB2 Event Traces** option to access the System Event Traces Easy Menu (EZDEVENT), as shown in [Figure 45](#).

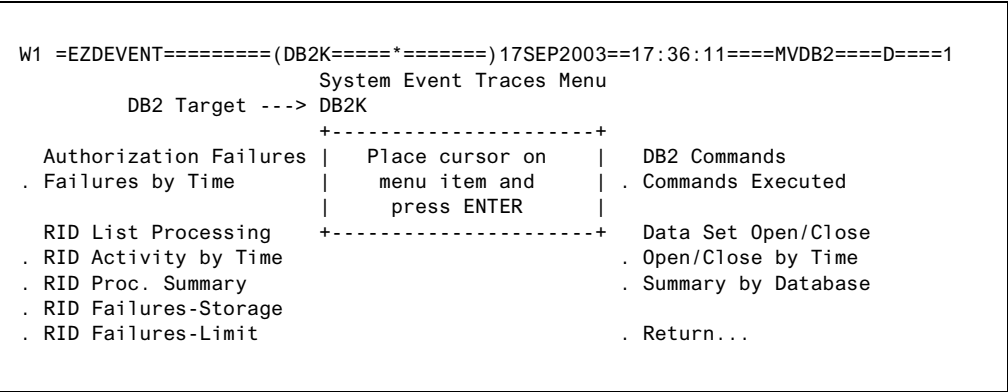

Figure 45. EZDEVENT Easy Menu—DB2 System Event Traces

2. From the EZDEVENT Easy Menu, hyperlink on **Commands Executed** to access the DB2 Command History view, CMDLIST.

From the CMDLIST view, you can identify who has issued commands and hyperlink to the CMDTEXT view to see the complete text.

---

## Chapter 3. Monitoring a DB2 Data Sharing Group

Monitoring DB2 data sharing increases the complexity of both the environment and the number of tuning *knobs* that needs to be analyzed and optimized.

The first key requirement is to be able to focus on the level of data that is required to understand how the data sharing group is performing, or to solve a particular problem. Since a data sharing group consists of multiple DB2 members, and these members work together and share resources, viewing each DB2 individually is no longer adequate.

These scenarios show you how to look at all the members concurrently so you can easily compare activity and resource usage across the group, as well as access summarized data for the whole group, such as group buffer pool activity, total database I/O to the shared tables, or global lock contention. Of course, you will still drill down to an individual DB2 member for details as needed.

In this practice session, you

1. Define a Single System Image (SSI) context for the data sharing group(s).
2. Check on current group activity.
3. Look at page set considerations.
4. Analyze global lock contention.
5. Tune group buffer pools.

**Note:** This practice session takes approximately one hour to complete.

## Define the Group Context

Start this scenario at the EZDSSI menu, described on page 9.

The first thing you need to do is make sure that you have a Single System Image (SSI) context defined for the data sharing group(s) you want to look at:

1. Select the **Set SSI Context** hyperlink (first option under Tools And Menus).

This presents a view of all the defined SSI contexts for MVDB2, as shown in [Figure 46](#).

*All Defined  
MVDB2 SSI  
Contexts*

```

17SEP2003 16:17:22 ----- INFORMATION DISPLAY -----
COMMAND ==>
CURR WIN ==> 1          ALT WIN ==>
W1 =CONASEL=====SYSD=====17SEP2003==16:17:21====PLEXMGR==D====4
CMD SSI      Product  Description      Num  Num
--- Context- -----      Targ Act
ALL          MVDB2    DB2 SSI context      3    3
ALLDB2       MVDB2    All DB2 Systems      9    9
DBGHC        MVDB2    DB2 5.1 Data Sharing Group  2    2

```

Figure 46. SSI Context Selection List (CONASEL)

2. If you do have a context defined for the data sharing group you want to monitor, all you need to do is hyperlink on the context name. This returns you to EZDSSI with the new context in effect.

If you don't have a context defined, you should define one now. (Even if you have a context defined, you may want to browse a little.) On the COMMAND line, type

**CONACTZ**

This view lists all SSI contexts (as known by your CAS and any connected CASs). Your CASID is shown on the window information line.

If you have multiple MAINVIEW products installed, here you see one of the most powerful features of SSI—that the same context can be defined for several different MAINVIEW products. Obviously, since each product may look at different target types, the selection criteria can vary.

3. Select the default context of **ALL** for **MVDB2** to hyperlink to the CONACT view.

Now you see each of the defined DB2 target subsystems, as shown in [Figure 47](#).

*All Defined  
DB2  
Subsystems*

```

17SEP2003 11:05:15 ----- INFORMATION DISPLAY -----
COMMAND ==>
CURR WIN ==> 1          ALT WIN ==>

ALL          MVDB2    DB2HC   ACTIVE   MAINVIEW for DB2

```

Figure 47. SSI Context Activity Manager (CONACT)

4. Type **CONDEF** on the COMMAND line to access the context definition dialog.
5. Browse an example of a context definition.  
If a data sharing group context already exists, hyperlink on the SSI context name to see how the target filters were defined. If you don't see the group, select any other context. (You will at least see the default context of ALL.)
6. Press **PF3** to return to CONDEF.
7. Type **EDIT** on the COMMAND line to obtain an edit lock.
8. Type **ADD** on the COMMAND line to display the Add SSI Context Definition panel, as shown in [Figure 48](#).

### Add a New Context

```

17SEP2003 11:10:14 ----- INFORMATION DISPLAY -----
COMMAND ==>                                     SCROLL ==> CSR
CURR WIN ==> 1          ALT WIN ==>
>W1 =CONDEF=====SYSD=====*(00 EDIT          )====PLEXMGR==D===10

----- ADD SSI CONTEXT DEFINITION -----
COMMAND ==>

SSI Context ==>
Description ==>

Inclusion Filters: (Target is included if any are true)
  1TGTNAME IN (DB1P,DB2P)
  2
  3
  4
  5
  6
  7
  8

Equivalent SUBSTITUTION parameters to be used in filter expression:
%1=TGTNAME      %2=TGTSYSTEM  %3=TGTPRODUCT  %4=TGTSERVER
%5=TGDESC

Type  END to add the SSI context definition
      CANcel to leave without adding

```

Figure 48. Add SSI Context Definition Panel

In this panel, you define the context name and description and the selection filters for the targets that will be part of this context. Help is available on each of the fields.

You can define several filter conditions, but, in this case, all you will need is to filter by **TGTNAME** (the shorthand for this is **%1**). Since most sites use some kind of naming convention for the members, you probably only need one filter condition; for example:

**%1 = DB?P**

would include DB2s named DB1P, DB2P, and so forth.

If you prefer, you can define an IN list; for example:

**TGTNAME IN (DB1P,DB2P)**

would include only the DB2s named DB1P and DB2P.

## Define the Group Context

9. Type the following commands to activate this definition:

```
END          (to return to the CONDEF view and complete the ADD)
SAVE        (to save the information)
INSTALL     (to dynamically activate this SSI context in this CAS)
```

10. If there are multiple CASs involved, you need to complete this definition in each CAS. (CASACT will show you a list of CASs and you can type **CON casid** to switch to another CAS.)
11. If they all share the same BBPARM (you still see the new definition after you switch to another CAS), you only need to type

```
CONDEF
EDIT
INSTALL
```

Otherwise, you must repeat the whole set of steps.

## Check Current Group Activity

Often you just want to check the health of each member of your data sharing group, and check on the activity levels. The previous dialogs covered how to check on multiple DB2s subsystems and their active threads. For data sharing, all you need to do is focus on just a data sharing group, instead of the default SSI context of ALL used earlier.

To view activity for a data sharing group:

1. You should have already set the context in the previous step. As a shortcut in the future, you can also simply type

**CON context** (example: CON DBGHC)

2. Now you can select options from the EZDSSI menu to look at just this group.

Try the **SSI Status - List DB2s** option again for a list of the DB2s in the data sharing group. This version of the STDB2 view is a good place to see how each DB2 member is performing. You can also drill down into details about a member.

Another useful option is **Current Threads (Elap)**, which will now show all threads in the data sharing group, sorted by elapsed time.

3. Return to EZDSSI. You now have the choice of a Data Sharing Menu or the Data Sharing Wizard. First take a quick look at the menu, just so you know what is available. Now choose the **Data Sharing Wizard** option to access the Data Sharing Wizard (WZDSHAR) menu, as shown in [Figure 49](#).

### Access Data Sharing Options

Figure 49. Data Sharing Wizard (WZDSHAR)

This wizard collects the most used options for data sharing in one place, including access to group buffer pool activity and status, global lock contention, and page set analysis that summarizes activity from all members. We will return here later.

The rest of this exercise will cover use of the wizards, but you also have direct access to some detailed data views here.

- Another tip to find information quickly on specific data sharing topics is to use the Topic Index to look up the DB2 term that you are interested in, such as “Group Buffer Pools” and “GBP-Dependent” in the **TOPICG** view or “Locks-Global” in the **TOPICL** view, as shown in Figure 50.

At any point when looking at another view, you can enter a view name **TOPICx** to directly access topics starting with that letter; for example, type **TOPICL** for lock information.

- Press **PF3** to return to EZDSHAR.

## Look at Page Set Considerations (I/O / GBP-DEP)

Data sharing means that some or all of the DB2 tables can be accessed concurrently from all members of the group. But the tools provided by DB2 to understand the impact of this are limited. This section shows the power of what SSI can do to make this easier.

To look at page set considerations:

1. One of the key tuning areas in DB2 is I/O analysis. But looking at I/O for shared page sets or volumes from one DB2 member at a time does not give a complete picture.

Select **Volume I/Os (SSI)** from the data sharing menu, EZDSHAR, to see a view of total I/O per volume from all members (PSVOLSSI), as shown in [Figure 51](#).

### Volume I/O for the Group

```

This value lists the amount of time, in minutes,
that must elapse before a data set can be a
candidate for pseudo-close (QWP1TMR).

ZPARM name: PCLOSET in DSN6SPRM

Tuning Tip: The PCLOSEN and PCLOSET parameters are
associated with pseudo-close. PCLOSEN
defaults to 5 system checkpoints and
PCLOSET defaults to 10 minutes. There
is a trade off in setting these
parameters. If these values are set
too high, data sets may remain
GBP-dependent for longer than
necessary and incur unnecessary
performance overhead. If these values

Figure 57. Page Set GBP-DEP Status (PSGBP)

You can not only see which member(s) is GBP-dependent, but also which member(s) has Read/Write Interest and how many pages from that page set are cached in each member’s local buffer pool.

## Analyze Global Lock Contention

One of the most important issues in data sharing is to control global lock contention, since it not only causes the usual problems of application availability you deal with in one DB2, but can significantly degrade performance in a data sharing group as well.

To analyze global lock contention:

1. Press **PF3** to return to the Data Sharing Wizard (WZDSHAR) and select **Lock Contention Wizard**.

The Global Lock Wizard (WZLKGOPT) is displayed, as shown in [Figure 58](#).

*Analyze  
Contention  
for a Group*

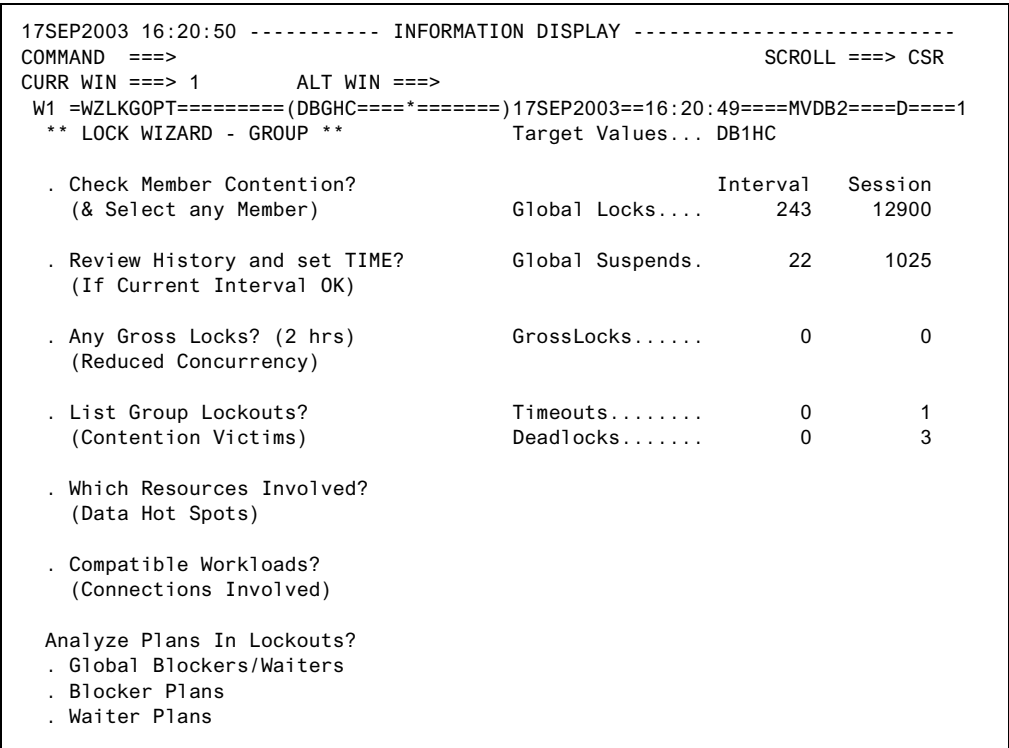

Figure 58. Global Lock Wizard (WZLKGOPT)

The Global Lock Wizard helps you step through the analysis of lock contention in DB2 for a data sharing group. It allows you to look at current status or choose an earlier time interval, perhaps one that a user of your system has complained about.

A history of the most important symptoms of lock problems—timeouts and deadlocks—is available, as well as information on system considerations and statistics that can point out potential causes of problems.

2. Select **Check Member Contention?**.

This view, shown in [Figure 59](#), enables you to see the key indicators for all of the members together, allowing you to identify quickly whether or not there are any global contention issues to analyze. The counts shown are for the time since DB2 started.

*Check Member Contention*

```

Figure 60. Lock Wizard Global/Local Contention (WZLKGCON)

This view provides the information to analyze both global and local lock contention for a selected member. Besides the most critical statistics, both for the current interval and since DB2 startup, the two key indicators of % global contention and % false contention are calculated for you. Thresholds are defined to highlight any value that exceeds the recommended value. Place the cursor on the **% Global Contention** header or fields to see an explanation of the calculation and what it means.

4. Press **PF3** to return to the Lock Wizard - Group panel (WZLKGOPT) and select **List Group Lockouts?** to see a list of the latest timeouts and deadlocks that have occurred in all the members of the group.

The *Global Contention* flag on the right is set to YES when the conflict occurred between threads running on different members, as shown in [Figure 61](#).

**Group  
Lockouts

```

Figure 65. Lockout Global Blocker Waiter Summary (LKBWZSSI)

This view lists a summary of blocker/waiter plans and systems. You can identify conflicting plans across multiple data sharing DB2 members. Again, the list of events for a particular combination is available with a hyperlink, so you can quickly check to see if there are any application scheduling problems.

## Tune Group Buffer Pools

After global locking, the next most important area of data sharing tuning is to determine whether or not the group buffer pools are the right size and have the correct ratio of directory to data entries to support your workload, based on the amount of inter-DB2 sharing that is occurring.

If any of these resources is lacking, overhead increases in the group buffer pools, the coupling facility, and the local pools. It can also cause unnecessary I/O.

To tune the group buffer pools:

1. Press **PF3** to return to the Data Sharing Wizard (WZDSHAR) and select **Review Group (Session)** to see an overview of key statistics about
  - Global Contention
  - Group buffer pool performance
  - GBP-dependent page sets
  - Coupling facility activity (castouts, failures)

### Data Sharing Member Overview

```

```

Figure 66. Data Sharing Wizard Group Members (WZDSGMEM)

This view shows you some of the key indicators per member. This allows you to identify quickly whether or not there are any performance issues to analyze. The counts shown are for the time since DB2 was started.

From here, you can hyperlink on any one DB2 to see all the member statistics for both the current interval and the session data since DB2 startup. Or you can return to the first panel to follow some of the analysis paths.

2. Press **PF3** to return to the Data Sharing Wizard (WZDSHAR) and select **Check GBPs** to access the GBP analysis section of the Data Sharing Wizard.

This decision panel provides options to analyze GBP size and the ratio of directory to data entries, as shown in [Figure 67](#).

GBP Analysis

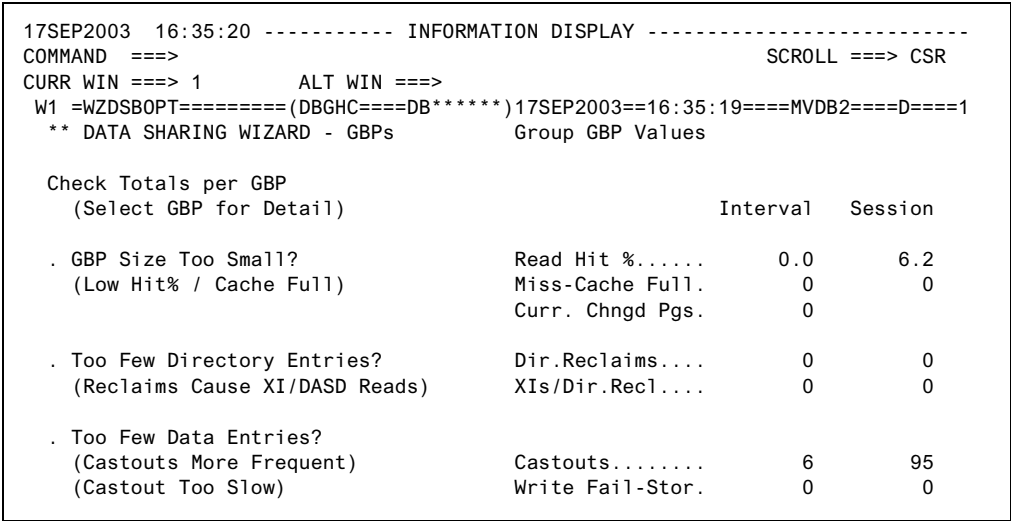

Figure 67. Data Sharing Wizard GBP Options (WZDSBOPT)

There are three diagnostic paths here, but, as an example, we are going to follow the path to analyze directory entries. Even if the pools are large enough, a lack of directory entries (used to register each page) can cause problems.

The key indicators on the right are there to help you decide whether or not you need to do additional analysis by following one or more paths. On this panel, all of these values are for the whole group, summarized for all GBPs.

Possible symptoms of too few directory entries are

- The occurrence of directory reclaims so that new pages can be registered
- The even worse consequence—that cross-invalidations of pages in the members’ local buffer pools are occurring because of these directory reclaims

If one of these indicators is greater than 0, the field is highlighted in red.

3. Hyperlink on **Too Few Directory Entries** to see a tabular list of all defined group buffer pools, as shown in [Figure 68](#).

### GBP Group Overview

```

```

Figure 69. Data Sharing Wizard GBP Directory Detail (WZDSGBRD)

This analysis panel provides details to help you determine whether or not a group buffer pool may have too few directory entries to support its part of the data sharing workload. It addresses the main issue—whether directory reclaims are causing cross-invalidations (XI) and probably increasing I/O.

In this panel, you now see the two key indicators again, but both as interval (current activity) and session (total since DB2 startup) counts.

The answer to the additional question of whether or not this is increasing DASD reads can only be seen by looking at statistics per member instead of at the group level.

- 5. Hyperlink on **Check Members for XI Miss** to see data sharing session activity counts per member for this group buffer pool, as shown in [Figure 70](#).

*Counts per  
GBP and  
Member*

17SEP2003 16:39:04 ----- INFORMATION DISPLAY -----									
COMMAND ==>					SCROLL ==> CSR				
CURR WIN ==> 1					ALT WIN ==>				
W1 =WZDSGBSA===== (DBGHC=====*)=====)17SEP2003==16:39:02====MVDB2====D====2									
GBP	DB2	Read	XI Read	NF Read	Changed	Clean Sync	Read Async	Read	
Name	Target	Hit %	Miss	Miss	Writes	Writes	Total	Total	
BP0	DB1HC	14.0	3	40	12	0	50	0	
BP0	DB2HC	22.2	1	13	20	0	18	0	

Figure 70. Data Sharing Wizard GBP Size Activity (WZDSGBSA)

The XI Read Miss column now shows whether or not any members had to do additional I/O to read in pages lost through reclaims and cross-invalidation. Non-zero counts are highlighted. From here, you can also hyperlink on a GBP to see interval and session counts for that GBP.

You have seen a few of the most important areas for data sharing monitoring. You have used a Single System Image context to enable you to monitor all members of a group, both individually and summarized, and to pull all the relevant data together. Now you have the tools to master the new and complex data sharing performance issues.

---

## Chapter 4. Tuning an Application with Trace

These scenarios teach you how to navigate easily through the MAINVIEW for DB2 trace setup panels and the displays of trace data, and acquaint you with the trace print utility.

In this practice session, you

1. Start an application trace and review the available options.
2. Review tips on running your tests with trace.
3. Look for application problems using the various trace displays.
4. Print a trace report for offline review.

**Note:** To complete the first exercise, you must have authorization to start detail traces. Contact your system administrator if you do not have authorization. If SAF security is in use, the resource name is “prefix.ssid.BBI.target.TRACE.D” or “prefix.ssid.BBI.target.TRACE.ALL”. If USERID security in BBPARM is in use, the parameter to be specified is DB2TRACE=D or ALL.

This practice session takes approximately two hours to complete.

## Start an Application Trace

To start an application trace, begin by checking the current traces:

1. From the Primary Option Menu, select the **TRACES** option.

OPTION ==> 4

This panel lists all the current traces, as shown in [Figure 71](#). They may be active and collecting data from DB2 (STATus is ACTV), or already complete but not yet purged (STATus is COMP). We will return here later to view your own trace.

*Current Traces*

*ST Command*

BMC Software ----- CURRENT TRACES ----- PERFORMANCE MGMT

Figure 71. Current Traces Application

2. Transfer to START APPLICATION TRACE.

COMMAND ==> ST

You must be authorized to start a trace and to specify certain options. See your system administrator for the trace privileges you have. If you cannot start a trace, just browse these instructions and then go to [“Look for Application Problems” on page 75](#) to view an already active trace.

## Specify Options

On the Start DB2 Trace Request panel, shown in [Figure 72](#), you can specify various options for your trace. Many traces can be started using just this first panel. If you want to review additional options, they are available on three more panels that are accessed much like DB2I SPUFI options.

### *Start Trace*

### *Using Defaults*

BMC Software -----		START DB2 TRACE REQUEST -----		PERFORMANCE MGMT	
COMMAND ==>				TGT==> DB2G	
PARM	==>	(Trace identifier)	START	==>	(hh:mm:ss)
TYPE	==> S	(S-Summary,D-Detail)	STOP	==>	(hh:mm:ss/#min)
STORAGE	==> 1000K	(Display buffer size)	WRAP	==> YES	(Y/N wrap buffer)
LOGTRAC	==> N	(Y/N log trace)	RST	==> HOT	(HOT,PUR,QIS)
TITLE	==> DB2 APPLICATION TRACE				
Specify Selection Criteria:					
DB2PLAN	==>				
DB2AUTH	==>				
DB2CONN	==>				
DB2CORR	==>				
DB2LOC	==>				
DB2PKG	==>				
CONNTYPE	==>				
Specify additional trace options: (* = processed)

Detail Trace Options	==> N (Y/N)				
Trace Log Data Set Options	==> N (Y/N)				
Press ENTER to process; END to cancel					

Figure 72. Start DB2 Trace Request Panel

## Start an Application Trace

### 1. Define a trace using mostly defaults.

#### a. PARM ==> **id**

You can specify any name as an ID, but try to make it descriptive. For example, use your initials or an acronym for the application being tested, plus a number to identify the test: JNL003, ABCTEST1, ABC2IO.

#### b. START ==>

Leave blank to start the trace immediately.

#### c. TYPE ==> **D**

A Detail trace collects the DB2 accounting record and additional events (DB2 performance trace IFCIDs) per thread. The default includes the basic start and end events, plan allocation data, exceptions (like timeouts), sorts, and all the SQL statements. This can be modified on a later panel.

#### d. STOP ==> **10**

This traces for 10 minutes and then stops collecting data. Even if you decide not to log a trace, the data is available for display until the trace is purged.

#### e. STORAGE ==> **1000K**

Use the site default size for the storage buffer (used for online display).

#### f. WRAP ==> **Y**

Use the default to wrap the data in the STORAGE buffer if it fills up.

#### g. LOGTRAC ==> **Y**

Specify Y to request trace logging. This allocates a VSAM log for this trace. You can recall the data for online display or print reports until you decide to delete the data set.

#### h. RST ==> **HOT**

Use the default to restart the trace automatically without loss of data if DB2 goes down and up while you are tracing.

#### i. TITLE ==> **user-specified title**

This field is filled in with the default, but you should specify a title that will help you later to identify the contents of this trace.

#### j. DB2AUTH ==> **userid,SYSOPR**

Specify your user ID to trace your own tests. Add SYSOPR to trace prefetch reads. You can also specify other selection criteria. For a detail trace, you must specify DB2PLAN or DB2AUTH to limit DB2 tracing. This is subject to DB2 restrictions (1 plan / 8 authids, or vice versa).

**Note:** If you qualify by plan, prefetch read I/O events cannot be captured.

### 2. Request the additional trace options to review the other panels.

Exception Filters ==> **Y**

Detail Trace Options ==> **Y**

Trace Log Data Set Options ==> **Y**

### 3. Press **Enter** to view the next panel.

4. Review the Exception Filters panel, shown in [Figure 73](#), but leave it empty.

*Narrowing  
the Trace*

```

BMC Software ----- DB2 TRACE EXCEPTION FILTERS ----- PERFORMANCE MGMT
COMMAND ==>                                         TGT -- DB2G

Specify Exception Filters:
ELAP  =>      GETPAGE =>      MAXLOCK =>      SQLDDL  =>
CPU   =>      PGUPD  =>      LOCKTBL =>      SQLDYN =>
ABORT =>      READIO =>      INCRBIND =>      SQLCTL =>
UIDCOM =>     LOCKSUSP =>     SQLSEL  =>      SQLFETCH =>
GETRIO =>     LOCKESCL =>     SQLUID  =>      SQLTOT  =>
RLF   =>      TIMEOUT =>     RIDFAIL =>      CLAIMDR =>
PWAITIO =>    PWAITLK =>     PWAITPF =>     PWAITOT =>
PFREQS =>     PFREADS =>     HPFAILS =>     PRLLGRP =>
PRLLRED =>    PRLLFALB =>
ELAPDB2 =>    CPUDB2  =>

```

Figure 73. DB2 Trace Exception Filters Panel

Specifying filters causes thread accounting records that do not meet the qualification to be discarded. The value can be a maximum (n) or a minimum (<n). For example, specifying ELAP ==> 10 only keeps threads with an elapsed time greater than 10 seconds. This is very useful when you are looking for poorly performing applications in an existing DB2 workload.

**Note:** If you specify several filters, they are ORed. A trace record is retained if any one of the comparisons is valid.

5. Press **Enter** to view the next panel.

6. Review the Detail Trace Options panel, shown in [Figure 74](#).

**Note:** You should review the recommendations in Volume 2 of the *MAINVIEW for DB2 User Guide* before executing detail traces of long-running threads.

BMC Software -----

DETAIL TRACE OPTIONS -----

PERFORMANCE MGMT

COMMAND ==>

TGT -- DB2G

Specify additional events:

SQL ==> Y (Y/N)

SCANS ==> N (Y/N)

I/O ==> N (Y/N)

LOCKS ==> N (Y/N)

DDF ==> N (Y/N)

DDFVTAM ==> N (Y/N)

Specify event compression:

GROUP SQL ==> Y (Y/N)

Specify data collection buffer options:

TRSIZE ==> 400K (Trace buffer size)

TRBUFF ==> 20 (# of trace buffers)

Figure 74. Detail Trace Options Panel

TRSIZE ==> (value shown is the default for your site)

This is the size of a data collection buffer. Without logging, the data collected for one thread is limited to two buffers. If you are tracing long-running applications, you might need to increase the size. With logging, multiple buffers can be written per thread and combined automatically when recalled online or printed.

TRBUFF ==>

You might need to increase this value to trace more concurrent threads or to provide multiple buffers for the logging of long-running applications. The recommended number is three or more times the number of concurrent threads to be traced.

**Note:** Volume 2 of the *MAINVIEW for DB2 User Guide* has additional recommendations that can help you trace special situations like capturing part of a long-running thread. See the chapter on “Using a Trace” and Appendix C, “Recommendations for Detail Traces of Long-Running Threads” in that book.

GROUP SQL ==> Y

Y groups many consecutive identical SQL statements together to save space and make the event trace easier to read; for example, combine many FETCHes.

7. Specify the additional DB2 events you want to trace.

SQL	==> Y	Default is Y for standard application tuning
SCANS	==> Y	Default is N, specify Y this time
I/O	==> Y	Default is N, specify Y this time
LOCKS	==> N	Default is N, leave as is - very expensive
DDF	==> N	Default is N, needed only for distributed work
DDFVTAM	==> N	Default is N, needed only for DDF VTAM analysis

Each of the other groups of events adds additional overhead. You can specify any combination; for example, SQL and I/O but no SCANS.

8. Press **Enter** to view the next panel.

**Logging  
the Trace**

9. Review the Trace Log Data Set Options panel, shown in [Figure 75](#), but leave the defaults.

```

BMC Software ----- TRACE LOG DATA SET OPTIONS ----- PERFORMANCE MGMT
COMMAND ==>                                                    TGT -- DB2G

Number of Logs ==> 1          (# data sets; >1 for auto switch when full)
First Log DSN ==>
                        Low level qualifier of DSN must be V01
                        Blank for default: CIR7.DB1D.BLANK.mmmdd.Thhmm.V01
                        Names without quotes will be prefixed with CIR7

Overwrite logs ==> Y      (Y/N) (Action when all logs used)
Archive PROC ==>          (Blank for none/PROCLIB member name)
Log switch time ==>       (HH:MM that a log switch is requested)

Disposition ==> NEW (OLD/NEW) If NEW, specify options below:

Volumes ==> (V00001,V00002,V00003)
Primary CYLS ==> 5          SMS Storage Class ==> SMSSTOR
Data DSN Suffix ==> D1      SMS Data Class ==> SMSDATA
                        SMS Management Class ==> SMSMGMT

```

Figure 75. Trace Log Data Set Options Panel

a. Number of Logs ==> 1

Multiple logs are usually needed only for continuous system traces for workload history.

b. First Log DSN ==>

Leave this blank to take the generated default. You must be authorized for dynamic allocation of a trace log. See your system administrator. If you are not authorized, there is a batch job (JXT011) to preallocate a log data set. Then type the name here and change DISPOSITION to OLD.

c. Overwrite Logs ==> Y

Y allows the latest trace data to be kept if it doesn't all fit in the log. N keeps the earliest trace data by quiescing the trace when full.

d. Archive PROC ==>

Leave blank. Not needed for simple single-log traces.

e. Log Switch Time ==>

Leave blank. Not needed for simple single-log traces.

f. Disposition ==> **NEW**

Leave NEW unless you had to preallocate a log.

g. Volumes ==>

This should be filled in with the default volume(s) for your site. If not, specify a volume the MAINVIEW for DB2 product address space (BBI-SS PAS) is allowed to use.

h. Primary Cyls ==>

Use the default.

## Start an Application Trace

10. Specify SMS values if necessary in your shop and defaults are not set.

```
SMS Storage Class    ==>
SMS Data Class       ==>
SMS Management Class ==>
```

11. Press **END** to process the options and return to the first panel.

## Activate the Trace

All options are now specified for your trace. The trace options are set to \*. If you want to drop the related options you specified, change the \* to **N**. To view them again, change the \* to **Y**.

When all options are \* or **N**:

1. Press **Enter** to submit the trace request.
2. Press **PF3** to return to the CURRENT TRACES panel.
3. Press **Enter** until the status of your trace changes to **ACTV**.

Data can now be collected. Enter some activity to be traced.

- If the status changes to **INV** (invalid), there was an error in your request that was not found in the preliminary syntax checking. An example of this kind of error would be a trace log data set allocation error because no space was available on the specified volume. You can see the detailed error messages on the Journal Log (press **PF5** to view).
- If the status changes to **QIS** (quiesced), the target DB2 is not up.

---

## Review Tips on Tracing Tests

There are many different scenarios for testing. Here are some hints on tracing a few of the most common tests.

- Testing your new application during development
  1. Qualify the trace by your own AUTHID. DB2 trace overhead is only incurred for the tests of your application. Depending on the number of users of the MAINVIEW for DB2 trace in your test DB2 system, you may be able to keep your trace request active through several test iterations, consolidating them on one trace log. (Only four detail traces can be active at one time.)
  2. BIND your program after the trace is started. This captures the text and EXPLAIN data of all static SQL statements in your trace output for reference when analyzing performance. EXPLAIN=YES is not required.
  3. If you don't set an automatic stop time when requesting your trace, don't forget to stop it when you have completed testing (use the Z line command in the CURRENT TRACES option). If you have logged the trace data, you should also purge the trace when complete. You can still browse and print the data from the log (HISTORY TRACES option). Otherwise, analyze the data from the online buffers and purge the trace when you are done.
- Analyzing the performance of an existing application
  1. If you have SQL Explorer, RxD2/FlexTools, or a similar tool, you can qualify the trace by PLAN.
  2. Set automatic start and stop times to cover a time span in which you expect sufficient activity.
  3. If the application usually runs well with only a few occurrences of poor performance, specify exception filters to save just those that you need to analyze. For example, select only those with high elapsed or CPU times, or with many GETPAGE requests or I/Os.
- Improving the performance of a bad SQL statement
  1. You may have identified a poorly performing SQL statement and now want to try out several different variations in the syntax to determine which is best. If you have RxD2/FlexTools or a similar tool, you can modify and execute the statement directly from the source while in ISPF edit. Otherwise, make the statement executable from SPUFI.
  2. Start the trace qualified by your AUTHID.
  3. Modify and execute each variation as dynamic SQL. You want to force the thread to terminate so an accounting record will be produced. This is done automatically with RxD2. With SPUFI, you must exit each time to terminate the thread.
  4. The trace automatically captures the SQL text, EXPLAIN data (with cost factor), and the accounting record and SQL performance statistics.

You now have all variations captured together in one trace for easy comparison.

- Comparing test to production
  1. Save the detail trace log from the last test run. Run a short detail trace in production after cutover to compare performance. You can either print batch reports or browse both trace logs in split screen mode.

## Look for Application Problems

Now it is time to become acquainted with the trace displays and learn how to use them for application tuning.

There are two options on the Primary Option Menu that display trace data:

- Option 4, TRACES

OPTION ==> 4                      TRACES - Current Application Traces

This option lists all currently active or complete trace requests. You have already viewed this option when starting your trace and checking that it started correctly. From this option you can see the trace data as it is being collected. And even after the trace is complete, it stays available here until you purge the trace.

Trace data is posted to the display buffer only when the accounting record is written. If you are tracing a longer running thread (detail), you can view the detail events as they occur with the UTRAC display. (Select the current USERS analyzer display, line select the detail display (DUSER) for your thread, and expand to UTRAC.)

When you trace long-running threads, logging is recommended so that data is not lost because of buffer shortages. The data should also be viewed from the logs instead of the buffers (see next option).

Press **PF3** to return to the Primary Option Menu.

- Option 5, HISTORY TRACES

OPTION ==> 5                      HISTORY TRACES - Historical Trace Data Sets

Traces that are logged are also always accessible through this option that lists all known trace log data sets. You can view your trace when it is running, after it is complete, and even after you have purged the original trace request—as long as it is worthwhile to keep the data set. This makes it easy to compare different tests, even a month or two apart, without keeping stacks of paper.

From the log you can recall the data online or print selected reports. The trace log data sets are displayed in descending order by date and time, as shown in [Figure 76](#), so you can easily find a newly created log. If you are looking for an older log, you can sort the display by any of the columns.

### Logged Traces

Figure 76. History Traces Application

Figure 77 summarizes many of the ways you can navigate among the trace displays accessed from either Current Traces, Option 4, or History Traces, Option 5. It is included here for your reference.

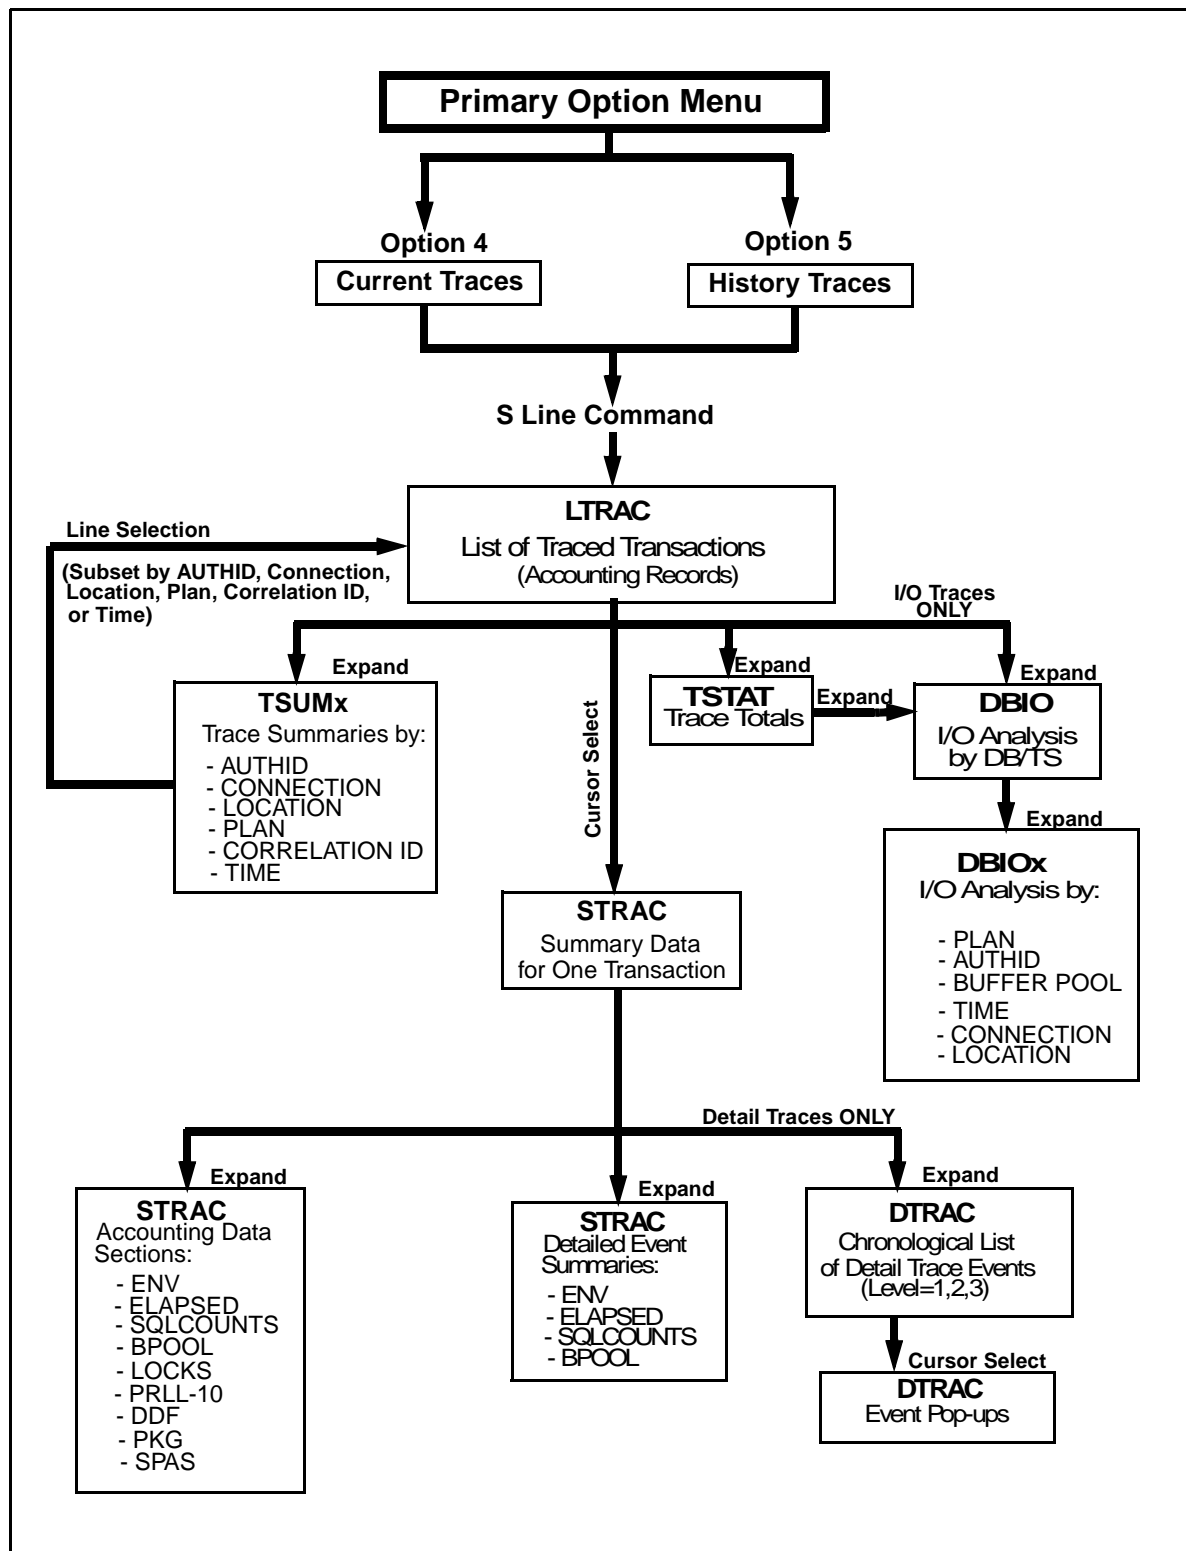

Figure 77. Trace Display Service Access

## All Trace Entries (DB2 Accounting Records)

Whether selected from Option 4 or 5, all the trace displays are the same, except for a few minor differences. So we will continue here with Option 5.

To view all trace entries in a trace log data set:

1. Sort by USERID.

COMMAND ==> **SORT US**

2. Locate your user ID (like ISPF LOCATE).

COMMAND ==> **L userid**

3. Select the trace log data set that you just created.

LC (Line Command)  
S (for Select)

The first panel of trace data is displayed, as shown in [Figure 78](#).

*Expand from

Figure 78. DB2 Trace Entries Display (LTRAC)

LTRAC lists all threads (trace entries) in chronological sequence, with the newest at the bottom. Each entry corresponds to a completed transaction, query, or batch job. There is one entry for each DB2 accounting record. In addition to the thread identifiers (plan, authid, connection), some of the most important performance indicators are shown.

4. Use the scroll keys **PF7** and **PF8** to scroll back and forth in the list.

ENTRIES IN DATASET on line 4 tells you how many threads were traced. (This line says ENTRIES IN BUFFER from a current trace.) Compare the values for ELAPSED, CPU, #STMTS, and GETPAGE and look for high activity.

**Note:** Use the **HISTORY** button to see all the data from the current TLDS. You *must* do this to see data for a long-running thread that has not yet terminated.

5. Tab to any entry and press **Enter** to see more detailed information.

Data for One Thread

The Summary Trace Entry display, STRAC, shows summary data for this thread. There are complete activity statistics from the DB2 accounting record. For a detail trace, there also are summaries of the captured detail events, such as SQL statements.

The most critical information is summarized in the base section, shown in [Figure 79](#). It includes

- Identifiers
- Completion status
- Commits and rollbacks
- A runtime graphic analysis of elapsed and CPU times
- The most important activity counts
- Key indicators of failures or possible problems

*Most Critical Information*

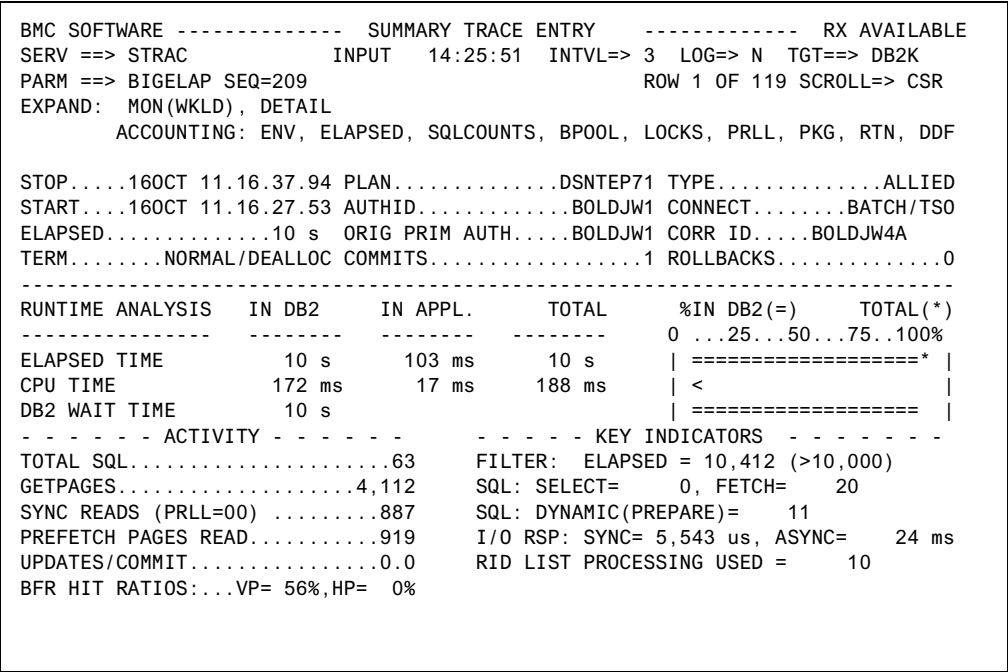

Figure 79. Summary Trace Entry Display (STRAC)—Base Section

## View DB2 Accounting Data

You can scroll down or expand to sections showing complete details on SQL statements by type, lock counts, buffer activity, and parallel I/O and package accounting:

1. Select **ELAPSED** in the ACCOUNTING EXPAND line.

If you run DB2 with Accounting Trace 2 or 3 active, an Elapsed Time Analysis section is displayed, as shown in [Figure 80](#).

*Why Are You Waiting?*

- - - - - ELAPSED TIME ANALYSIS (ACCTG CLASSES 2 3 ONLY) - - - - -					
CATEGORY	#EVENTS	AVG/EVENT	ELAPSED	%TOTAL

*NOT ACCOUNTED			38 ms	0.36	<

Figure 80. STRAC Elapsed Time Analysis (ELAPSED) Section

The graph tells you at a glance where the most time is being spent—and what you should concentrate on in tuning: more time in the application or in DB2; if in DB2, are the times for I/O, prefetch reads, or lock waits unusually high?

2. Select **BPOOL** in the ACCOUNTING EXPAND line.

This section provides a complete summary of activity for each buffer pool accessed plus totals, as shown in [Figure 81](#).

*Buffer Pool  
Problems?*

- - - - - BUFFER POOL ACTIVITY - - - - -				
ACTIVITY	TOTAL	BP0	BP1	BP2
GETPAGES.....	4,112	80	2,032	2,000
SYNC READS.....	887	0	887	0
GETPAGES/READIO....	4.6	0.0	2.3	0.0
COND. GP FAILURES..	0	0	0	0
SEQ. PREFETCH REQS.	10	10	0	0
LIST PREFETCH REQS.	200	0	0	200
DYNAMIC PREFETCHES.	0	0	0	0

-R/W INTEREST.....	1	-	1	
-NO R/W INTEREST..	1	-	1	
CF READS (DATA NOT IN BUFFER POOL)				
-DATA RETURNED....	2	-	2	
-R/W INTEREST.....	1	-	1	
-NO R/W INTEREST..	1	-	1	
CF-WRITE (CHGD PGS)	2	-	2	
CF-WRITE (CLEAN PG)	1	-	1	

Figure 81. STRAC Buffer Pool (BPOOL) Section

The GETPAGE / READ I/O ratio can give you a good indication of synchronous READ efficiency, which directly affects thread elapsed time. However, you should also check the prefetch requests, since some I/O may be occurring asynchronously.

3. Select each of the expand buttons shown in the ACCOUNTING line.

This is all the data you would see with a low-overhead summary trace.

4. The package accounting section is available only if DB2 accounting class 7 is active, and shows a breakdown of elapsed, CPU, and wait times (class 8) per package/DBRM, as shown in [Figure 82](#).

*Select a  
Package  
for More  
Information*

- - - - - PACKAGE / DBRM OVERVIEW (ACCTG CLASSES 7,8 ONLY) - - - - -						
PACKAGE/ DBRM	NO. SQL	CPU TIME	WAIT TIM	ELAPSED	%TOTAL ELAP.	
						0 . . . 25 . . . 50 . . . 75 . . 100
RXSEL1M	5	23 ms	611 ms	860 ms	9.78	*
RXSEL2M	6	21 ms	514 ms	538 ms	6.12	*

RXSELAM	14	28 ms	256 ms	286 ms	3.25	<

Figure 82. STRAC Package/DBRM Overview (PKG) Section

Select one package to see further details in a pop-up display.

5. Press **PF3** to return to STRAC.

## View Detail Event Summaries (Detail Trace Only)

Since you started a detail trace, there are several more sections with data summarized from detail event records. You don't have to collect and analyze each type of data separately, the MAINVIEW for DB2 trace does it all for you. You can keep scrolling to see all the data, but there is a quicker way to select just the data you want.

### SQL Statement Summary

To view summary data for each SQL statement:

1. Tab through the SUMMARIES EXPAND line to the **SQL** button and press **Enter**.

The SQL Summary is displayed, as shown in [Figure 83](#), with important statistics for each SQL statement, showing totals and averages across all executions. If the plan contains multiple DBRMs, the statements are sorted by package/DBRM (program).

*Check Each  
SQL Statement*

Figure 83. STRAC SQL Summary Section

2. Scan the PERCENT ELAPSED column.

The percent tells you how much this statement is contributing to the total thread elapsed time. An average may be high, but if only executed a few times, the statement may not be worthwhile tuning.

3. Scan the SORT RECS column to see which statements invoked a sort.

Although EXPLAIN tells you a sort will be used, it can't tell you whether many rows will be selected and sorted, or just a few. This column does. (Of course, as always, you must adjust this by any differences between your test and production tables.)

4. Scan the PAGES SCANNED - INDX column.

This tells you whether an index was accessed and how many pages were scanned. If this value doesn't meet your expectations, there is more information on index accesses a little further along.

5. Check for referential integrity processing. See the PAGES SCANNED - REF column.

6. Sort the display by PAGES SCANNED - DATA.

```
PARM ==> traceid,SEQ=nn,SQL,SORT=PD
```

7. Now sort the display by PAGES SCANNED - DATA within Program.

```
PARM ==> traceid,SEQ=nn,SQL,SORT=PDP
```

The first characters of the column header are used to request a sort. Adding P as the third character keeps all the statements for each DBRM together. All options are defined in the HELP panels (PF1). (The sort is supported only when you expand to the section, not when you scroll to it.)

Evaluate SQL  
Predicates

8. Place the cursor on one of the SQL statement lines and press Enter.

This pop-up display, shown in [Figure 84](#), shows the complete statistics for that statement, displayed as averages per execution. Where the single line shows total counts of pages scanned, the pop-up display shows averages not only for pages but also rows accessed.

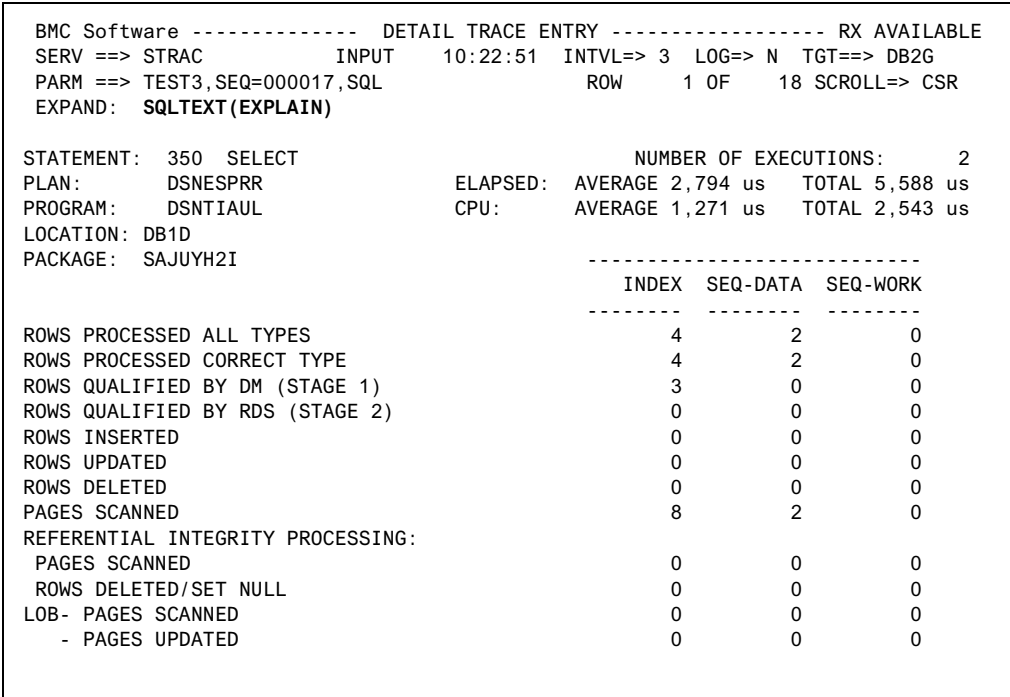

Figure 84. STRAC SQL Statement Pop-Up Display

These are the statistics that allow you to evaluate the SQL predicates. For example, ROWS QUALIFIED BY RDS are caused by Stage 2 predicates and are more expensive than rows qualified in the first stage by the Data Manager (ROWS QUALIFIED BY DM). Of course, there may be variations per execution depending on host variable values. You will see how to find the statistics per single statement execution later.

9. If Rx2 is installed and this is a static SQL statement, the **SQLTEXT(EXPLAIN)** expand button is highlighted. You can select this to view the SQL text from the catalog and access available EXPLAIN data from a PLAN\_TABLE or do a dynamic EXPLAIN. This feature is shown later in [“Using Rx2 with MAINVIEW for DB2” on page 123](#).

If the MAINVIEW for DB2 – Data Collector component is available, you can access more thorough EXPLAIN information by hyperlinking on the **MVDB2/DC Admin/Archive** option on the EZDB2 Menu and then selecting option **E (EXPLAIN Interface)**. You can view static SQL EXPLAIN data from the plan or package SQL data, or from PLAN\_TABLE data that has been previously populated.

10. Press **PF3** to return to STRAC.

## Table Space / Index Space Scans

To view table space and index space scans:

1. Tab through the EXPAND line to the **SCANS** button and press **Enter**.

Here you can see a summary of all scans by table space and index space, as shown in [Figure 85](#).

*Review  
Table Spaces  
and  
Index Access*

Figure 85. STRAC Database Summary Section

This data is available only if you requested SCANS on the trace request. It allows you to review the number of rows and pages accessed per page set, and also see which indexes were used.

Lock and I/O Events

To analyze lock and I/O problems:

- 1. Tab through the EXPAND line to the **IO/LOCK** button and press **Enter**.

This display, shown in [Figure 86](#), is a summary of all lock and I/O activity by this application, shown by table space and index space. The lock data is available with any detail trace. The I/O data is available only if you requested I/O events on the trace request, which can be expensive, depending on the application characteristics.

Analyze Lock  
and  
I/O Problems

```

```

Figure 86. STRAC Database Lock and I/O Summary Section

For traces by AUTHID, where SYSOPR is included, you will also see counts for prefetch read requests and the number of pages read for this thread. The other counts are all for synchronous I/O within the application. In other words, the ELAPSED time shown here is part of the total thread elapsed time. Reducing the total number of synchronous I/Os has a direct effect on performance.

We will show you later how to relate these I/Os to the packages/DBRMs and even the SQL statements that caused them. (See [“Application I/O Analysis”](#) on page 92.)

## Avoiding Expensive Lock Event Traces

A lock trace is usually only requested to analyze a specific locking problem, since it causes a great deal of DB2 overhead and also generates many trace records for MAINVIEW for DB2 to store online and/or log. Therefore, before you decide to trace LOCK events, you should analyze the following detail trace events available in DTRAC (shown next):

### LOCK-SUMMARY (display LEVEL=2)

This event appears near the end of the thread processing. It shows the maximum number of page locks held and the highest lock state for each page set (table/index space) accessed.

### LOCK-TMO (display LEVEL=1)

This event is shown for any thread terminated by either a timeout or deadlock. It shows the page set involved and identifies the first holder of the lock that was in contention, as well as the state of the lock (for example, held exclusive). It is followed by either a DEADLOCK or LOCK-TMO-DET event (display LEVEL=2) that gives complete details.

### LOCK-SUSP (display LEVEL=3)

This event is shown for all lock suspensions. It shows the elapsed time suspended, the page set, the type of entity locked (for example, a data page, index tree, and so on), page number if applicable, and lock state.

## Sort Information

To evaluate the impact of sorting:

1. Tab through the EXPAND line to the **SORTS** button and press **Enter**.

A Sort Summary of all the sort activity for this plan execution is displayed, as shown in [Figure 87](#).

*Evaluate  
Impact  
of Sorting*

```

***** END OF DATA *****

```

Figure 87. STRAC Sort Summary Section

When scrolling through STRAC, this section is at the end of the display. The SORT ELAPSED time allows you to evaluate the impact of sorting on the total thread elapsed time. Since there may be multiple sorts, the values are shown as averages, maximums, minimums, and totals.

Now you have seen all the summarized data for one thread by browsing through an STRAC (Summary Trace Entry) display. Even with a low-overhead summary trace, the complete accounting data, elapsed time analysis, buffer pool usage analysis, and DDF information is available. The other summarized data depends on the type of events you decide to trace: SQL, SCANS, IO, LOCKS.

2. Press **PF3** several times until you return to the initial STRAC display.

## Another Thread

If you have traced several thread executions, you may now want to view another thread. Look at the PARM field. The SEQ=nnnnnn field shows you the sequence number of this trace entry (accounting record plus summarized details) and allows you to navigate between entries.

To view another thread:

1. Press **PF10** to scroll to the next chronological entry.
2. Press **PF11** to scroll back to the previous entry.
3. Select the **SQLCOUNTS** expand button to view the summary of all SQL statements; then press **PF10** several times.

The display shows the SQL counts for the following threads. This is an easy way to compare particular statistics (such as SQL, elapsed times, or GETPAGES) for several threads.

## Detail Events

There is another level of trace data available for a detail trace. It shows all the traced events for a thread in chronological sequence. To see the detail event statistics:

1. Tab through the EXPAND line to the **DETAIL** button and press **Enter**.

The DTRAC (Detail Trace Entry) display allows you to follow the sequence of events during thread processing, as shown in [Figure 88](#).

*Follow the  
Sequence of  
Events*

Figure 88. Detail Trace Display for a Thread (Level 2)—DB2 Requests

The number and type of events shown depend on how much you decided to trace (more events, more overhead). The simplest detail trace captures just the major events and exceptions in the life of the thread. This trace also has SQL, SCANS, and IO.

2. Look at the first event, CREATE-THD.

Events like this, with start and end trace records, are matched and displayed on one line with relative start time, elapsed, and CPU times. Events that occur within another event (like I/O for a scan) are indented.

3. Look at the PARM field.

The SEQ number is the same as that shown on the Summary display (STRAC). But now there is a new parameter of **LEVEL=2**. This parameter allows you to widen or narrow your view of all the traced events. Level 2 shows you the major events (for example, the first event you see is probably PLAN-ALLOcation) and SQL.

4. Change the level to 1 to see just the SQL statements.

PARM ==> traceid,SEQ=nnnnnn,LEVEL=1

Browse through the SQL statements to find one you want to know more about.

5. Tab to that statement and press **PF7** to scroll it to the top (SCROLL => CSR).

6. Change the level to 3 to see SCANS and I/O.

```
PARM ==> traceid,SEQ=nnnnnn,LEVEL=3
```

The events always remain in chronological sequence, and the event at the top of the screen remains there. Now you can see all of the events that occurred in processing the SQL statement—index scans, data scans, table space opens, sorts, dynamic SQL text and EXPLAIN data, I/O, and so on.

7. Move the cursor to an SQL statement and press **Enter**.

Here are the statistics for the single SQL statement, shown in [Figure 89](#), available in a pop-up display whenever you need them, but out of the way when browsing the events.

Event Pop-Up

Access More Information

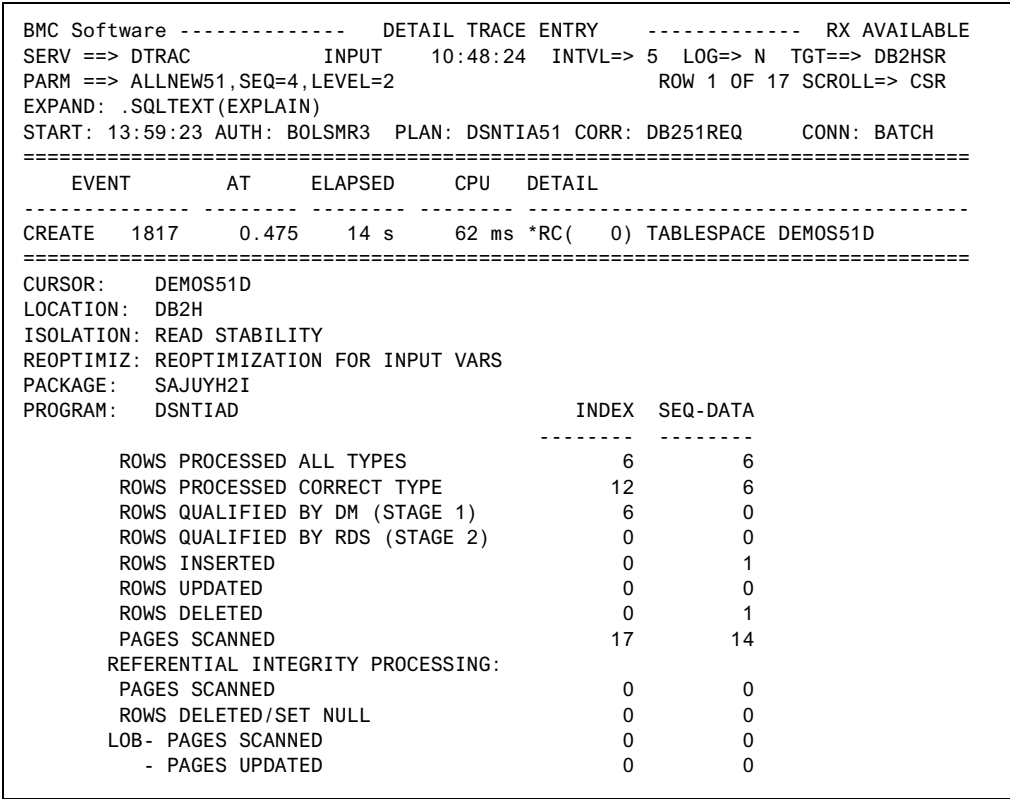

Figure 89. DTRAC SQL Statement Pop-Up Display

Any event that has an asterisk at the beginning of the DETAIL column has a pop-up display. The detail column shows the most important data, but many trace records have much more information available. This data varies by event type. For example, for an SQL statement, you see the return code, cursor, indicators about data access (Data/Index/Work = D/X/W), and pages scanned.

You have already seen the SQL pop-up display; the same row/page statistics are available per scan. Some other important pop-up displays are

BIND-TEXT	Text of dynamic SQL (also static SQL if BIND traced)
EXPLAIN	EXPLAIN data for dynamic SQL (also from BIND)
LOCK-SUMMARY	Summary of locks held per page set
LOCK-TMO	Identification of lock holder causing a timeout/deadlock
RIDLIST	Statistics on RID list processing, success, or failure

8. Press **PF3** three times to return from DTRAC to the LTRAC list of thread entries.

## Summarized Data for All Threads

Now look at data that has been summarized for all the threads that have been traced:

1. In LTRAC, tab to the **TOTALS** expand button and press **Enter** to access the TSTAT display, as shown in Figure 90.

### Trace Totals

LOCK SUSPENSIONS = 158			
RID LIST PROCESSING USED = 2,070			

Figure 90. Summary Statistics for All Trace Buffer Entries (TSTAT)—Base Section

The TSTAT (Trace Statistics) display provides a summary of all traced threads. Much of the data is similar to that shown for one thread in the STRAC display, so just browse through it using the **PF8** key or select the desired accounting data sections from the EXPAND line.

TSTAT can be useful in application tuning when you trace just one plan. It gives you an overview of the performance of the plan to see if you even need to go into further detail analysis of single thread executions. If the average values meet expectations and the maximum and minimum don't vary greatly, you may be able to stop here. Also, TSTAT summarizes the key indicator values to show whether any exceptional conditions, such as RID pool failures, have occurred. After all, the art of performance analysis and tuning is to spend your time where you get the biggest payback.

2. Press **PF3** to return to LTRAC.

Application I/O Analysis

Earlier you looked at the I/O for one thread. Now look at the I/O performed for all the threads traced.

The best way to analyze the I/O workload is to use the series of DBIOx displays, available with an expand button from either LTRAC or TSTAT on an I/O trace, as follows:

- 1. Tab to the **I/O-DB/TS** expand button and press **Enter** to access the DBIO display, as shown in [Figure 91](#).

Summarized  
I/O Events  
by Page Set

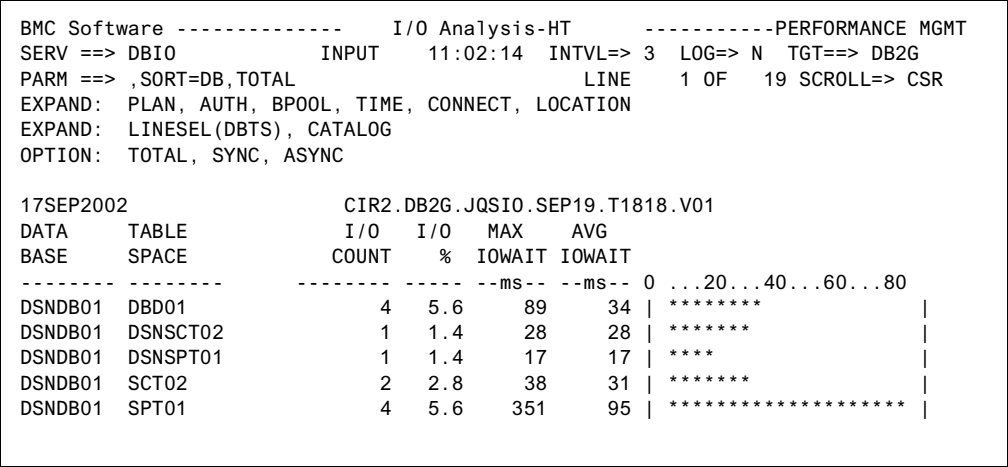

Figure 91. I/O Analysis by Database / Table Space Display (DBIO)

The first display (DBIO) summarizes the I/O events by database and table space. You can see the number and percent of I/O per table space and index space, as well as average and maximum I/O wait times. From here, you can use the expand buttons, line selection, and sort parameters to focus on the area of most interest, whether a particular table space, an application, or a specific time period.

- 2. Tab to **SYNC** on the OPTION line and press **Enter**.

Now only synchronous I/O are displayed. SYNC is now in the PARM field. TOTAL (the default) includes both synchronous and asynchronous I/O. ASYNC shows the prefetch I/O.

- 3. Tab to **PLAN** and press **Enter**.

Now the I/Os are summarized by plan.

- 4. Tab to the **I/O %** column and press **Enter** to sort the plans with the highest amount of I/O at the top of the list.
- 5. Line select one of the plans and press **Enter**.

The original display by page set is shown again, but is now qualified to show only the I/Os for the selected plan.

Press **PF3** to return to the DBIOP display.

- 6. Tab to **PKG/PGM** and press **Enter**.

The programs (DBRMs or packages) per plan causing the I/O are now identified.

7. Tab to **SQL** and press **Enter**.

This lowest level now identifies each SQL statement causing I/O, as shown in [Figure 92](#).

### SQL Statements Causing I/O

BMC Software ----- I/O Analysis-SQL Stmt -----PERFORMANCE MGMT									
SERV ==> DBIOS		INPUT		12:01:32		INTVL=> 3		LOG=> N TGT==> DB2G	
PARM ==> ,SO=PL,SYNC				LINE		1 OF		3 SCROLL=> CSR	
EXPAND: LINESEL(DBIO), CATALOG, HISTORY									
OPTION: TOTAL, SYNC, ASYNC

								0 ...20...40...60...80	
RXDB2	RXSEL2M	228	30	93.8	21464	1505		*****	
RXDB2	RXSEL4M	115	1	3.1	49	49		*****	
RXDB2	RXSEL9M	228	1	3.1	49	49		*****	

Figure 92. I/O Analysis by SQL Statement (DBIOS)

- At any time you can return to LTRAC (press **PF3** four times from DBIOS). Select a single thread (for example, one with a high elapsed time) and look at the I/O per page set for that one execution summarized in the STRAC IO/LOCK section.
- Select the STRAC **DETAIL** button to view the detail events. Change the display level to **3** to see I/O events.

You can now see each I/O in the chronological sequence in which it was executed, following the SQL statement that caused it, with elapsed and CPU times.

## Viewing Detail Trace Data for Active Threads

When you are running a detail trace, the events that you have just looked at in the DTRAC displays are available from the Detail User Status (DUSER) display for an active thread that is being traced.

- Access the DUSER display by following the steps on page [12](#).
- Use the **Tab** key to move to the **UTRAC** button on the EXPAND line and press **Enter** to view this data from the buffers.

As the threads complete processing, the data becomes available from the Current Traces and History Traces options as described previously in this chapter.

---

## Print a Trace Report

You have now run a trace and viewed it online. However, depending on the results, you may want to have a hardcopy for further analysis. Batch reports can also be valuable tools during an application review meeting.

**Note:** This section describes printing a trace, but you may also want to look at the accounting reports produced from SMF data, either from DB2 tables or directly from the extracted DB2 accounting records. See the *MAINVIEW for DB2 Performance Reporter User Guide* for more information.

To begin this exercise:

1. Press **PF3** several times until you return to the History Traces panel (Option 5).

This panel not only provides access to view the trace data online but also offers several line commands to simplify management of the trace log data sets:

<b>W</b>	Show the options used for this trace
<b>P</b>	Generate the JCL to print a batch report
<b>D</b>	Delete this data set from the trace directory
<b>E</b>	Reset the log data set for reuse
<b>V</b>	Verify that the directory entry matches the data set contents
<b>N</b>	Add a new data set to the directory (moved from another system)
<b>A</b>	Archive the data set (only if an archive started task was specified)
<b>F</b>	Free a data set currently being read

Usually you will need only W(SHOW), D(DELETE), and P(PRINT). We are going to concentrate now on P. You can try the others when you need those functions.

## All Data per Traced Thread

To print a trace report showing all data per traced thread:

1. Select your trace log data set for print.

LC (Line Command)  
P (for PRINT)

The Batch Trace Print panel is displayed, as shown in [Figure 93](#), where you can specify options to print a batch report.

### Printing a Trace

```

BMC Software ----- BATCH TRACE PRINT ----- PERFORMANCE MGMT
COMMAND ==>                                     TIME --- 15:00

```

Figure 93. Batch Trace Print Panel

2. If this is your first time using this option, you must update your job statements.

Update Job ==> Y

3. Press **Enter** to display a job statement data entry panel.

Fill in the required information and return using **PF3**.

4. Set the option to **N**.

5. Fill in the options for a report.

TITLE1 ==> **any title**    Optional. Centered in first report header.  
TITLE2 ==> **any title**    Optional. Centered in second report header.

Data Selection is optional. The selection fields can be used to reduce the amount printed from a long trace. The date and time fields are primed with the start and end date-time of the trace.

REPORT SELECTION:

LTRAC ==> N  
STRAC ==> **ALL**                      Print data per thread traced.  
DTRAC ==> N  
POPUP ==> N  
TSUM ==>  
TSTAT ==> N  
DBIO ==>

There are many different reports that can be generated, either singly or in combination. Browse “Printing a Trace” in Volume 3 of the *MAINVIEW for DB2 User Guide* for a full explanation of the options and to see sample reports. There is also a sample JCL member DZTBPRNT you can use when you want to generate multiple reports or print reports from SMF data. The control statements for several sample reports are provided in BBSAMP member DZJPnnnn, with comments to point out some of the most useful variations.

The reports are based on printouts of the online displays, so the options are selected using the names of these displays, like LTRAC, STRAC, DTRAC. In this tutorial we have chosen **STRAC=ALL** as the most useful report for application tuning. It shows the following for each thread traced:

- **Basic DB2 accounting record** data
- **Environmental Indicators** section
- **Elapsed Time Analysis** section
- **SQL Statement Execution Counts** section
- **Buffer Pool Usage Analysis** section, including Global Buffer Pools
- **Lock Activity** section, including Global Locks
- **I/O Parallelism** section
- **Routines** section (stored procedures and user-defined functions)
- **DDF Summary** section (if distributed work was done)
- **Package/DBRM Overview** section (if accounting trace 7 is active)

These sections are included for detail traces:

- **SQL Summary** section with summary statistics per SQL statement
- **Database Summary** section with scans per page set
- **Database Lock and I/O** section with locks and/or I/O data per page set
- **Sort Summary** section (if any sorts were performed)

6. Press **Enter** to validate your specifications.

These options are saved in your profile and used to initialize the fields the next time this panel is requested.

7. Press **PF3** to review the generated JCL in edit mode.

The options you specified are inserted into a pattern job DZJPTRAC in BBPROF. You may want to copy this JCL into your own UBBPROF profile data set and modify it.

8. Check the rest of the options.

There are many more print options than can be shown on the panel. The sample job contains a short description of these options. Scroll to the bottom to review them.

9. Submit the job.

**COMMAND** ==> **SUB**

Of course, if you prefer, you can **SAVE** the JCL for later execution, or even **CANCEL** it completely.

10. Press **PF3** to return to the Batch Trace Print panel. You can issue another request now if desired.

## Other Examples

When the job is completed, review the output. You may want to try other report combinations too. Here are a few examples:

- For an SQL statement summary per thread, sorted by Average CPU usage, followed by average SQL row processing statistics per statement:

**LTRAC** ==> **Y**  
**STRAC** ==> **SQL, SORTSQL=AC, SQLPOPUP**

- For a detail event trace per thread, with pop-up displays per SQL statement:

**LTRAC** ==> **Y**  
**DTRAC** ==> **Y**  
**POPUP** ==> **SQL**

- For SQL statement text and EXPLAIN data for all dynamic SQL executed or BINDs of static SQL:

**POPUP** ==> **(BIND-TEXT, EXPLAIN)**

- For a summary of I/O counts and wait times per database, table space, and plan (from an I/O trace):

**DBIO** ==> **XP**

- To summarize by plan, database, and table space:

**DBIO** ==> **PX**

There are also many formatting options you can adjust:

**NEWPAGE**      Control page breaks

**WIDTH**        Specify wide (133) or narrow (81) output

**LINECNT**      Adjust the number of lines printed per page

**HEADING**      Suppress headings

**MAXPAGES**    Limit the amount of output to prevent an unexpectedly high print volume

---

## Chapter 5. Analyzing the DB2 Workload

These scenarios teach you how to gain a quick overview of summary thread history data to identify problem areas and drill down to further detail if needed to pinpoint exception threads. You will also learn to use the trace displays and the sorting and selection features to pinpoint problem areas and exception threads.

In this practice session, you

1. Analyze recent workload history through the Thread Interval Summary views.
2. Perform detailed analysis of the thread data in an MVDB2 TLDS.
3. Perform detailed analysis of the thread data in the MVDB2/DC trace data sets.
4. Analyze DB2 I/O per table space.
5. Print workload reports for offline review.

**Note:** This practice session takes approximately one hour to complete.

## Analyze Recent Workload History

Sometimes you might need to go back in time to analyze recent history of your DB2 workload; for example:

- To make a quick check of DB2 performance from an application perspective
- To identify system and application exceptions and relate the problems to the threads that caused them
- To analyze the performance of a specific application
- To develop an understanding of the workload profile and spot deviations

## Thread History Collection

MAINVIEW for DB2 sets up a summary trace named THRDHIST of the complete DB2 workload that is started automatically and runs continuously. This trace captures the DB2 accounting records and is inexpensive to run. Usually the system administrator chooses to log the data to a group of wraparound trace log data sets (TLDSs). The view interface described here is only available from active or complete TLDSs.

If the MAINVIEW for DB2 – Data Collector (MVDB2/DC) component is active, your administrator may have chosen to collect thread history in MVDB2/DC as input to batch reporting instead of DB2 SMF data. In this case, thread history can also be viewed from the Data Collector active trace data sets. Because the data is compressed, typically a much longer time period of thread history can be made available online than in an MVDB2 TLDS.

## Accessing Thread History Data

Thread history data, whether on MVDB2 TLDSs or in MVDB2/DC active trace data sets, can be accessed from one place. Common thread interval history views provide summary performance data and exception analysis of your DB2 workloads. They display summary data by both 15-minute time intervals and connection type, and allow drilldown to the detail thread accounting data (although the drilldown is currently different for the two data sources).

To access all the views for thread interval history analysis:

1. Select the **Thrd Workload History** hyperlink on the EZDB2 Menu and press **Enter** to access the Thread History Trace Log List view (HTLOGS), as shown in [Figure 94](#).

### Trace Logs

```

```

Figure 94. HTLOGS View—Thread History Trace Log List

This view displays information about all available sources of thread accounting history. It includes each trace log data set (TLDS), as well as data from the MAINVIEW for DB2 – Data Collector active trace data sets, selected by date if available. The entries are sorted by end date and time, so typically the MVDB2/DC entries are at the top, followed by the most current THRDHIST TLDSs. TLDSs that are currently being updated are displayed in green. (For an active trace, this value is not available. If logging is in progress, 99999 is shown to indicate that the hyperlink is accessible.)

You can use this view to review the sources of thread history data and select one for workload summary analysis by hour, interval, or connection type, or drill down to detail thread accounting data. The **Number Intvls** column indicates how much time is covered by this data source. For example, 8 (15-minute) intervals is 2 hours.

Workload Summaries

First, go through the summary views. The following sections cover the drilling down to detail threads.

- 1. Choose an entry with recent data from the HTLOGS views.  
  
Of course, you can choose any earlier TLDS if you want to see past history. In this case, first sort the view by TRACE ID so that you can easily find all the THRDHIST entries. (Enter **SORT** in the command list and place the cursor in the **TRACE ID** column.)
- 2. Hyperlink from the **Number Intvls** column to begin your analysis of the selected data source and see a detailed summary view of all the thread data on that log, as shown in [Figure 95](#) and [Figure 96 on page 102](#).

**Note:** This hyperlink will not be active for an active trace without logging. You can only use the hyperlink on the **Number Threads** column (described in the next section).

Thread Summary

Figure 95. HTDTLZ View—Thread Interval Summary History, Top Portion

This view displays a detailed summary of all the thread data on the selected thread history source. You can use this information to get an overview of your DB2 workload for the selected time frame.

The top portion shows a thread summary with elapsed and CPU time analysis. You can immediately see the number of threads, any unusual number of exceptions, the impact on the system (CPU usage), and whether the percentage of class 3 wait time, as either an average or a maximum, is out of normal guidelines.

- 3. If you need more detail, scroll down to the bottom portion of the view, as shown in [Figure 96](#).

Figure 96. HTDTLZ View—Thread Interval Summary History, Bottom Portion

Here you can see key activity indicators (as totals, averages, and maximums) and a detailed breakdown of what kind of thread exceptions have occurred.

4. Scroll back to the top of the view to access hyperlinks for further analysis by hour, interval, or connection type. Hyperlink from the **Date** field to see a summary of thread processing by hour, as shown in [Figure 97](#).

Hourly Data

Figure 97. HTHOURZ View—Thread History by Hour

You can use this information to identify when workload processing problems or thread exceptions have occurred. You can sort it by any of the columns to look for particular problems like high class 3 wait times or too many exceptions. Type **SORT A** or **SORT D** on the **COMMAND** line and place the cursor in the column that you want to sort by.

5. Hyperlink from the **Hour** column to see thread data for the selected time period by interval and connection type, as shown in [Figure 98](#).

Figure 98. HTINTVLC View—Thread Interval by Connection Types

You can use this information to determine which connection types were experiencing problems during a selected interval.

6. Hyperlink from the **End Time** column to see detailed information about the selected interval and connection type in the HTINTVLD view.

This view looks the same as the HTDTLZ view that you first saw, but now it is qualified to show only the information you are interested in to analyze why the workload from this connection type was experiencing problems or an unusual pattern of activity.

7. Press **PF3** until you return to HTDTLZ to try out the other hyperlinks for alternative analysis paths.

Next, hyperlink from the **Start Time / End Time** field to see a summary of thread history data by interval in HTINTVLZ. This view is similar to HTHOURZ, but the data is summarized by 15-minute intervals.

Again, you can drill down on **End Time** to see the data for an interval broken down by connect type, if needed. In any of the tabular views like the HTINTVLC view, you might want to take the hyperlink on **Total Excepts** to see only the detail exception counts (instead of the hyperlink on End Time to see the full detail).

8. Press **PF3** until you return to HTDTLZ and hyperlink from the **Connect Type** field to see a summary of thread processing by connection type in HTCTYPZ.

From here, you can drill down on one **Connect type** to see the breakdown by interval.

9. Press **PF3** until you return to HTLOGS. Select the data source from which you have been viewing summary information and hyperlink on the **Number Threads** column to access the detailed thread data behind the workload summaries.

The data presentation of the detail data is different depending on whether the source is an MVDB2 TLDS or MVDB2/DC trace data sets.

**Note:** A common view-based query function is planned for a future release.

## Workload Analysis from an MVDB2 TLDS

A feature of providing the thread history application through the Application Trace is that all of the trace displays are available for navigation so that analysis can be done for any workload group down to the individual threads, or up to one selective summary display.

1. Choose a recent TLDS THRDHIST entry in the HTLOGS view. The hyperlink on **Number Threads** takes you to the main thread list display, LTRAC, as shown in [Figure 99](#).

This display lists all the individual thread accounting records in that trace log. There can be a lot of data, so let's try to break it down to simplify analysis.

### List of Threads in a TLDS

BMC Software -----				DB2 TRACE ENTRIES		----- RX AVAILABLE

Figure 99. DB2 Trace Entries Display (LTRAC)

2. Use the **Tab** key to place the cursor in the second expand line on the **TIME** button.

This action summarizes the data into hourly intervals, similar to the HTHOURZ view, but now it is in a formatted trace display that cannot be customized. However, you can change a few things about the display by updating parameters, as shown in [Figure 100](#):

- Overtyping I=1H with **I=10M** to see the data by 10-minute intervals.
- Overtyping GRAPH=NO with **GRAPH=AVG** to see a relative graphic representation of the values shown.
- Overtyping SORT=IS with **SORT=ISD** to sort the most recent interval to the top of the list.

Average Values

BMC Software ----- TRACE SUMMARY BY TIME ----- PERFORMANCE MGMT					
SERV ==>	TSUMT	INPUT	15:38:38	INTVL=> 3	LOG=> N TGT==> DB2G
PARM ==>	THRDHIST,INTVL=10M,SORT=ISD,GRAPH=AVG	ROW 1 OF 2 SCROLL=> CSR			
EXPAND:	LINESEL(LTRAC), HISTORY	ENTRIES IN BUFFER 1 - 53			
19SEP02		THREAD HISTORY		19SEP02 - 17SEP02	
INTERVAL	#THREADS	AVG ELAPSED	AVG CPU	AVG #STMTS	AVG GETPGS
START	38	00:05:12	464 ms	34.9	67.3
-----	-----	-----	-----	-----	-----

18:50:00	***	**	*	***	*****
18:40:00	*	*	<	*****	***
18:30:00	*****	<	<	*	**
18:20:00	****	*	**	*****	*****
18:10:00	*****	*****	*****	**	*****

Figure 100. Trace Summary by Time Display with GRAPH=AVG

3. Press **PF7** to scroll down—and back in time.

4. Specify a temporary scroll value to move back to the most recent interval.

SERV ==> **M**

Press **PF8** to scroll to the top of the display.

5. To view totals instead of averages:

PARM ==> THRDHIST,SORT=ISD,I=10M,GRAPH=**TOT**

Averages give you a better view of application performance, while the totals show system throughput. Note how the numbers in the column headers change, as shown in [Figure 101](#). These are the maximum values detected, and the graphs show percent of maximum: red / highlighted if > 90 percent.

Total Values

BMC Software ----- TRACE SUMMARY BY TIME ----- PERFORMANCE MGMT					
SERV ==>	TSUMT	INPUT	15:38:38	INTVL=> 3	LOG=> N TGT==> DB2G
PARM ==>	THRDHIST,INTVL=10M,SORT=ISD,GRAPH=TOT	ROW 1 OF 2 SCROLL=> CSR			
EXPAND:	LINESEL(LTRAC), HISTORY	ENTRIES IN BUFFER 1 - 53			
19SEP02		THREAD HISTORY		19SEP02 - 17SEP02	
INTERVAL	#THREADS	TOT ELAPSED	TOT CPU	TOT #STMTS	TOT GETPGS
START	38	03:17:59	17 s	616	2,560
-----	-----	-----	-----	-----	-----
19:00:00	*****	<	*	*****	*****
18:50:00	***	**	***	*****	*****
18:40:00	*	*	****	****	****
18:30:00	*****	<	*****	**	**
18:20:00	****	*	**	*****	*****
18:10:00	*****	*****	*****	*****	*****

Figure 101. Trace Summary by Time Display with GRAPH=TOT

6. Place the cursor on a line with a lot of activity and scroll it to the top with **PF7**.

For example, this could be a time you need to analyze because a user reported a problem.

7. Now focus on smaller time intervals by changing the **INTERVAL(I)** value.

```
PARM ==> THRDHIST, SORT=ISD, I=01M, GRAPH=TOT
```

Any interval in minutes or hours is accepted, but values that divide evenly into 60 (M for minutes) or 24 (H for hours) are easier to read.

8. You can also change the sequence to sort by any column.

```
PARM ==> THRDHIST, SORT=TG, I=01M, GRAPH=TOT
```

For example, this sorts by TOTAL GETPAGES (use the first letters of the column headers) to help identify times of high buffer activity. Or change ISD to IS to sort by INTERVAL START but with the oldest data on top.

(You could also tab to the column you want to sort on and press Enter.)

9. After the graphics display has helped you easily identify an interval to focus on, you may want to see the numbers behind the graphics.

```
PARM ==> THRDHIST, SORT=TG, I=10M, GRAPH=NO
```

The numeric display shows both averages and totals.

10. Locate an interval on the display that has at least 20 threads, or the largest you can find.

If you are trying this step out on a test system, you might need to change the interval back to **I=1H**.

11. Use the tab key to place the cursor on that line and press **Enter**.

You are now viewing a list of each individual thread that executed in the selected interval. A **TIME** keyword has been added automatically to the parameters. You have returned to the LTRAC display that you saw before, but it is reduced to a subset of threads. (See [Figure 99 on page 105](#).)

12. Use the **Tab** key to move through the second EXPAND line to the **PLAN** button and press **Enter**.

The panel is similar to the one you saw earlier per interval, but now the threads for the one selected interval are *summarized by PLAN*, as shown in [Figure 102](#).

*Values for  
Each Plan*

BMC Software ----- TRACE SUMMARY BY PLAN ----- RX AVAILABLE									
SERV ==> TSUMP		INPUT		14:24:47		INTVL=> 3		LOG=> N	
TGT==> DB2G		PARM ==> THRDHIST, TIME=1810-1820, SORT=PL, GRAPH=NO				ROW 1 OF 5			
SCROLL=> CSR									
EXPAND: LINESEL(LTRAC), HISTORY

DSNUTIL	2	6,740 ms	186 ms	0.0	72.0	13 s	372 ms	0	144
DSN8CC22	8	6,380 ms	18 ms	7.5	10.0	00:02:20	398 ms	165	220
*** END OF SUMMARY ENTRIES ***									

Figure 102. Trace Summary by Plan Name

You could also have selected one of the other TSUM buttons to summarize by: **AUTHID(AUTH)**, **CONNECTION(CONNECT)**, or **LOCATION(LOC)**.

**Note:** The GRAPH=NO change you made earlier is carried forward. You can change back to the graphic display any time by overtyping the NO with **YES**.

13. Place the cursor on one of the plans and press **Enter**.

Now you are back at LTRAC with a list of threads executed for that one plan in the interval being investigated. A PLAN keyword has been added to the parameters.

Isolating Problems

You can continue this process of selecting, sorting, and categorizing until you have identified specific exception threads:

- 1. Select one thread (for example, one with a high elapsed time) and press **Enter**.

Now you have the complete DB2 Accounting record available to you in the STRAC (Summary Trace Entry) display. Here you can see SQL counts, buffer activity, various key indicators (such as RID processing failures), lock counts, and elapsed/CPU times, as shown in Figure 103.

Complete  
Accounting  
Data

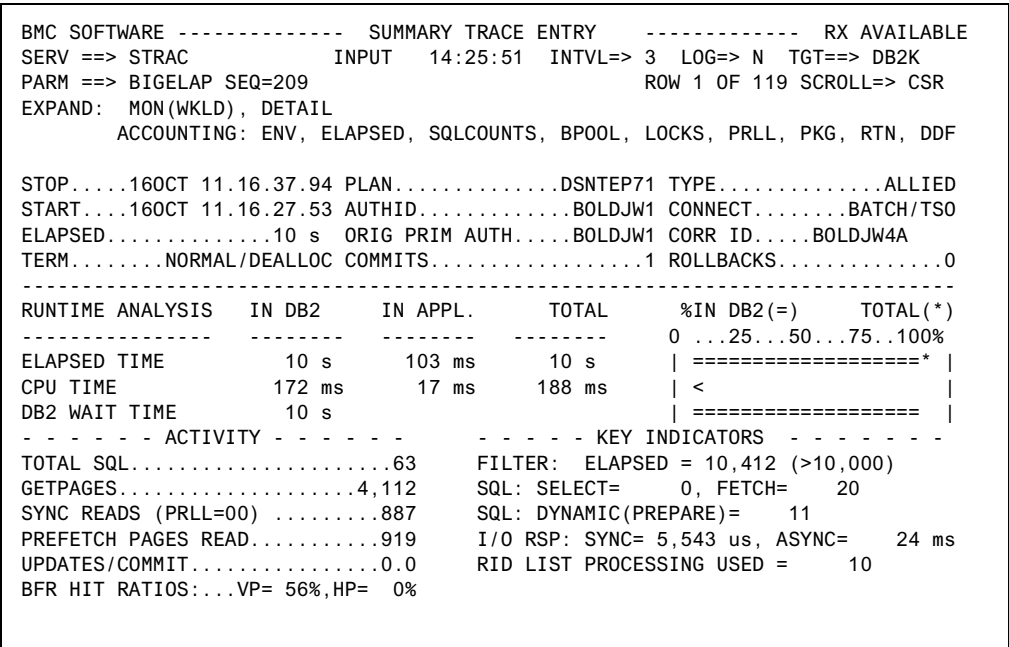

Figure 103. Summary Trace Entry Display (STRAC)—Base Section

- 2. If you run with Accounting Class 2 or 3, don't forget to scroll down or select the **ELAPSED** button to see the graphic display of elapsed times and wait categories.
- 3. The other accounting detail data can be accessed by scrolling or using the expand buttons.
- 4. Press **PF3** to return to LTRAC, the list of completed threads.

5. Tab through the EXPAND line to the **TOTALS** button and press **Enter** to access the Trace Statistics display, as shown in Figure 104.

*Totals —with  
the Qualifiers  
You've  
Selected*

Figure 104. Summary Statistics for All Trace Buffer Entries (TSTAT)

The TSTAT (Trace Statistics) display summarizes the data from the selected threads you were just viewing. It provides an easy way to evaluate a problem area that is broader than just one single thread execution.

The values you are looking at now summarize the performance of the one plan you previously selected. Look at the **PARM** field in the third line. You will see the selections you made by selecting lines in TSUMT (**TIME=hhmm—hhmm**) and TSUMP (**PLAN=xxxxxxx**).

6. To see all activity starting at a specific time, change (or add) the **TIME** parameter with just a start time.

PARM ==> THRDHIST, **TIME=hhmm**, PLAN=xxxxxxx

7. Press **PF3** to return to LTRAC.

The parameter change is still in effect.

8. To see all activity for a generic group of plans, change (or add) the **PLAN** parameter using mask characters in the plan name (plus sign for one position, asterisk for multiple positions).

PARM ==> THRDHIST, TIME=hhmm, **PLAN=xxx\***

The list now shows all plans starting with 'xxx'.

We have gone through examples of using **TIME** and **PLAN**, but you can also narrow your view of the workload in the same way using the other selections.

**A|AUTHID=** To select by user or user group (**TSUMA**)

<b>C CONNECT=</b>	To select by connection name ( <b>TSUMC</b> ) (TSO, BATCH, DB2CALL, cicsid, imsid)
<b>L LOC=</b>	To select by DDF location ( <b>TSUML</b> )
<b>D DAY=</b>	To select by relative day when the trace spans days (1 = date of first accounting record in the trace buffer) (can also be specified as a range of days)

Remember also that if you need to check whether there were any unusual conditions at a particular time, you can go to the Journal log (LOG or PF5) and do a FIND for that time to view DB2 messages and MAINVIEW for DB2 exception messages.

9. Press **PF3** to return to the HTLOGS view.

Workload Analysis from MVDB2/DC Active Trace Data Sets

Because the data available in the trace data sets usually consists of many more threads, two hyperlinks are provided for detailed analysis.

- 1. Return to the HTLOGS view and choose an entry (if available) with **MVDB2DC** as the TRACE ID.
- 2. Hyperlink from the **Number Threads** column to see an hourly summary of the thread accounting records in the the active trace data sets for that day, as shown in [Figure 105](#).

Hourly Summary

Figure 105. THACINTV Report

- 3. Scroll through this hourly summary until you find an hour with some interesting data that you want to investigate further.
- 4. In the Data Collector reports, use the **ZOOM** commands to navigate for drill down.

Each report has a list of available zooms at the top of the report. Enter any of the one-character zoom command characters by overtyping any + (plus sign) on the left side of the report (use the **Tab** key to move from one to the next). For example, in THACINTV, enter **P** to see a summary by plan of the threads in that hour (THACPLAN).

5. On THACPLAN, use the **L** zoom to see a summary list of the individual threads (THACLIST), as shown in Figure 106.

*List of  
Individual  
Threads*

Want to See*

DOMELFIL/I	Local Filters	19:54:22
Command =====>		
The following filters are in effect. Press Enter without update to continue.		
Source of data . . . : Subsystem DC41		
Start time . . . . . : Based on activation		
Duration . . . . . : 000 days 08 hrs 00 mins 00 secs (rolling)		
Period length . . . . : 000 days 01 hour 00 mins 00 secs      Periods:      8		
Filtered by . . . . . : No qualifiers		
Select one of the following. Then press Enter.		
1. Data Source	- Select data from monitor or data set	Set from *Default*
2. Interval	- Select, format data by time	*Default*
3. Qualifier	- Select data by qualifier value	*Default*

Figure 107. THACQLTV Report Qualification Panel

You can qualify by various DB2 identifiers, narrow the time period, or even access older data saved in archive data sets.

**Note:** If you have very large active trace logs with high thread volumes, it is recommended that you use interval filtering to select what you really need to see. This reduces the amount of data to be processed, speeds the return of the data, makes it easier to analyze, and avoids possible storage problems.

Specify  
Qualifiers

9. Select option **3** to specify various qualifiers, as shown in [Figure 108](#).

DOMELFIQ/I

Local Filters/Qualifiers

LINE 1 OF 23

Command =====> \_\_\_\_\_

Scroll ==> CSR\_

Type the following information to include or exclude data. Then Exit.

- one or more exact values to include or exclude (wildcards are allowed)
- one or more qualifier lists to include or exclude -- lists begin with )
- ? to display existing qualifier lists
- ?xxxxxxx to view, modify, or create a qualifier list named )xxxxxxx
- Qualifiers marked with (t) are the only ones applicable to tracing.

Figure 108. Qualifiers Panel

**Note:** The DB2 subsystem you selected from MVDB2 is no longer defined. Once you select this panel, you must enter at least one DB2ID, which will usually be the one you started analyzing. However, in data sharing systems you may want to broaden the analysis to the members in the group.

Optionally add other qualifications by plan, Auth ID, or any other ID shown on this panel.

10. Press **PF3** once and then select option **2** to specify a start time and duration.

11. Press **PF3** again and then select option **1**.

Normally you will not need to use this panel. But if the data you are interested in has already been archived, you can enter the archive data set DSN here to access it. Later, you may want to choose the Archive Directory option on the main MVDB2/DC panel, which shows you the available archive files and the time period each covers. Bypass both of these suggestions for now.

12. Press **PF3** to go back again and now press the **Enter** key without specifying an option.

You are back to the THACINTV report as shown before, but it only shows the data that you just selected. From here you can drill down to the threads that you want to review.

---

## Analyze DB2 I/O

It is also possible to start other, more detailed, system-wide traces to assist in workload analysis. However, authorization is required for such traces because of the potential overhead, so you may not be able to perform the setup for this dialog. In this case, just browse through the instructions so you understand the features offered. Then you can request such a trace when you need it from your system administrator.

In this example, you analyze I/O usage per page set (table spaces and index spaces). If you run DB2 with Accounting Class 2 or 3, increases in the average I/O wait times may indicate a problem that should be investigated. You can see this value in the ELAPSED TIME ANALYSIS section of TSTAT (select any time period or application of interest), or you may want to do a trend analysis from historical data kept in Performance Reporter tables.

## Run a System I/O Trace

To run a system I/O trace:

1. From the Primary Option Menu, select the **I/O** option.

```
OPTION ==> 7
```

The I/O Analysis Options panel is displayed, as shown in [Figure 109](#).

### Trace I/O Events

```

BMC Software ----- I/O ANALYSIS OPTIONS ----- RX AVAILABLE
COMMAND ==> 7                                           TGT==> DB2G

Display Buffer Pool I/O Data:

  1 I/O BY DB/TS   - Display Realtime Data by Database / Tablespace
  2 I/O BY BP00L   - Display Realtime Data by Buffer Pool
  3 I/O BY VOLUME  - Display Realtime Data by Volume
  4 I/O BY DATASET - Display Realtime Data by Data Set

Display I/O Data from a Trace:

  5 CURRENT TRACES - List Current I/O Traces: n Active, nn Complete
  6 HISTORY TRACES - List All History I/O Traces

Start a DMR I/O trace:

  7 START TRACE    - Review Primed Options / Activate (Start Trace Panels)

Print SMF/GTF I/O Traces

  8 DB2 TRACE      - Print Instructions

```

Figure 109. I/O Analysis Options Panel

2. Go to the Start Trace request panels.

```
COMMAND ==> 7
```

You need to collect the I/O events for a short time period.

**Note:** If you do not need to access the following I/O analysis online, read the instructions in Option 8 about writing DB2 I/O trace data to SMF/GTF and printing reports.

3. The required keywords to start an I/O trace are primed in the Start DB2 Trace Request panel.

Specify any additional options necessary for this exercise and start the trace. (Possible additions to primed options are in bold type.)

```

PARM    ==> IOhhmmss           Trace ID
TYPE     ==> D                 Detail trace
STORAGE  ==> 1000K             Display buffer size
LOGTRAC  ==> Y                 Log to dynamically allocated data set
TITLE    ==> DB2 I/O SYSTEM TRACE Descriptive title
START    ==> hh:mm:ss         Cover peak period
STOP     ==> 15               Stop after 15 minutes
DB2AUTH  ==> +                 Trace all threads
Detail Trace Options ==> *     Next panel shows I/O events selected
  SQL    ==> N                 SQL events turned off to reduce overhead
  I/O    ==> Y                 Specify I/O events
  TRBUFF ==> 50               Increase buffers to trace many threads

```

4. Let the trace run to completion.

## Analyze I/O by Page Set

To analyze I/O by page set:

1. Return to the I/O Analysis application (Option 7 from the Primary Option Menu).
2. Browse the collected trace data.

COMMAND ==> 5 (Current Traces)

Or, if you logged the trace:

COMMAND ==> 6 (History Traces)

3. Select the trace you requested (traceid IOhmmss).

LC (Line Command)

s (for Select)

The first panel of trace data, a list of all threads executed in this time period, is displayed. However, go first to the summary data for the whole trace.

4. Tab through the EXPAND line to the **I/O-DBTS** button and press **Enter**.

This summarizes all I/O activity by page set for the total DB2 system. It shows total (synchronous and asynchronous) I/O measurements, as shown in [Figure 110](#).

### Summarized I/O Events

```

BMC Software ----- I/O Analysis-HT ----- PERFORMANCE MGMT
SERV ==> DBIO          INPUT  11:02:14 INTVL=> 3 LOG=> N TGT==> DB2G
PARM ==> ,SORT=DB,TOTAL LINE 1 OF 19 SCROLL=> CSR
EXPAND: PLAN, AUTH, BPOOL, TIME, CONNECT, LOCATION
EXPAND: LINESEL(DBTS), CATALOG
OPTION: TOTAL, SYNC, ASYNC

19MAR01          CIR2.DB2G.JQSI0.MAR19.T1818.V01
DATA  TABLE      I/O  I/O  MAX  AVG
BASE  SPACE      COUNT %  IOWAIT IOWAIT
-----
----- --ms-- --ms-- 0 ...20...40...60...80

DSNDB01 SPT01          4  5.6  351   95 | ***** |

```

Figure 110. I/O Analysis by Database / Table Space Display (DBIO)

You can see the number and percent of I/O per table space and index space, as well as the average and maximum I/O sort times. You can select only the synchronous or asynchronous (prefetch) I/Os by tabbing to the **OPTION** line. Only the synchronous I/Os directly affect application response time.

5. Tab to the **AVG IOWAIT** column and press **Enter** to sort the highest average delays to the top of the display.

The parameter is changed to `SORT=AI`. A high average I/O wait may point out possible poor DASD response times.

6. Tab to the **MAX IOWAIT** column and press **Enter** to sort the highest maximum delays to the top of the display.

The parameter is changed to `SORT=MI`. A high maximum value may point out an occasional contention problem that could be masked in the averages.

- 7. Tab to the **I/O COUNT** column and press **Enter** to sort the highest number of I/Os to the top of the display.

The parameter is changed to SORT=IC. Index spaces with high I/O counts may be good candidates for a separate buffer pool configured for index data.

Analyze I/O by Application

I/O problems may be caused by DASD response or contention problems, or they may be caused by the application just doing too many I/Os. To analyze I/O by application:

- 1. Tab to the **PLAN** button and press **Enter** to access the I/O Analysis by Plan display, as shown in Figure 111.

*I/O  
Summarized  
by Plan*

BMC Software ----- I/O Analysis-Plan -----PERFORMANCE MGMT

RXDB2		36	50.7	1028	80		*****		

Figure 111. I/O Analysis by Plan Display (DBIOP)

This summarizes all the I/O collected by the trace by plan.

- 2. Tab to the **I/O %** column and press **Enter**.

This sorts the applications with the highest amount of I/O to the top.

- 3. Line select one plan.

This returns you to the DBIO display by DB/TS, but shows only the table spaces accessed by that plan.

- 4. Try out some of the other summarizations, selection, and sorting options to narrow the focus of the displays.

Of course, all the other trace displays are available, including the Lock and I/O Summary per thread (STRAC) and the detail I/O events (DTRAC).

The next section covers printing I/O reports.

---

## Print Workload Reports

Printing workload reports is usually done from the DB2 tables of performance data supported by Performance Reporter. This gives you long-term history and trending, as well as the full flexibility of SQL for defining your own reports in addition to the predefined set. See “Reports from DB2 Tables” in the *MAINVIEW for DB2 Performance Reporter User Guide* for more information.

Also, selective or total accounting reports, in either a short or a long format, can be printed from DB2 accounting records that are extracted from Data Collector archive files or one or more SMF files. For example, you can select from a specific time period or by plan, authorization ID, and so on. The reports also can be summarized by various criteria. See “Data Collector Reporting Facilities” or “Reports from SMF” in the *MAINVIEW for DB2 Performance Reporter User Guide* for more information. A summary of batch printing capabilities is in [“Printing Reports” on page 147](#).

However, this data is often not available to answer questions about the workload until the next day. The batch trace print facility is designed to fill the need for quick reports. All the trace summary report formats are available, in any combination.

There are different types of input:

- One or more trace log data sets  
For example, of the Thread History trace.
- Archived trace logs (without reloading to VSAM)  
For example, thread history from two weeks ago.
- Data Collector archive files
- An SMF history file containing DB2 Accounting records or I/O trace IFCIDs
- The live SMF data sets
- A GTF trace data set

If you are writing accounting data to the Data Collector trace data sets, you can also run the Data Collector reports against any of the archived files, or against the active trace data sets. See “Data Collector Reporting Facilities” in the *MAINVIEW for DB2 Performance Reporter User Guide* for more information.

The examples in this dialog are made with the THRDHIST and system I/O traces.

To print a workload report:

- 1. From the Primary Option Menu, select the **HISTORY TRACES** option.

OPTION ==> 5

- 2. Locate an entry with a TRACEID of THRDHIST and select it for print.

LC (Line Command)  
P (for PRINT)

The Batch Trace Print panel where you can specify options to print one batch report is displayed, as shown in [Figure 112](#).

Specify Options

BMC Software ----- BATCH TRACE PRINT ----- PERFORMANCE MGMT  
COMMAND ==> TIME --- 15:00  
  
Update job ==> N (Y/N - update job statement) (END to edit JCL)  
Title line 1 ==>  
Title line 2 ==>  
  
Data Selection:  
From date ==> 16MAR2001 Time ==> 1125  
To date ==> 17MAR2001 Time ==> 1412  
  
PLAN ==>  
AUTHID ==>  
CONNECT ==>  
CORR ==>  
LOC ==>  
DB2PKG ==>  
  
REPORT SELECTION:  
LTRAC ==> NO (YES/NO)  
STRAC ==> NO (NO,ALL,SUMMARY,section1,section2..)  
DTRAC ==> NO (YES/NO)  
POPUP ==> NO (NO/ALL/SQL/event1,event2,...)  
TSUM ==> (A/C/L/P/T) SORT ==> (for any TSUMx)  
TSTAT ==> NO (SUMMARY/ALL/NO) INTERVAL ==> 1H (for TSUMT only)  
DBIO ==> (X/A/C/F/L/P/T/xx) IOSORT ==> (for any DBIOx)  
IOINTVL ==> 10M (for DBIOT only)

Figure 112. Batch Trace Print Panel

You can also use the sample JCL **DZTBPRNT** to tailor and submit a set of reports. This JCL is set up so that it can invoke several sample report members that explain many of the available print options.

- 3. If this is the first time you are using this option, you may want to update your job statements first (Update Job ==> **Y**).

## 4. Fill in the options for a report.

```
REPORT ==> traceid    Specify any name. Used as the output DD.
DDNAME ==>              Optional.
TITLE1 ==> any title  Optional. Centered in first report header.
TITLE2 ==> any title  Optional. Centered in second report header.
```

Data Selection is optional, but can be used to reduce the amount printed. The date and time fields are primed from the trace log data set.

```
REPORT SELECTION:
LTRAC  ==>  N
STRAC  ==>  N
DTRAC  ==>  N
POPUP  ==>  N
TSUM   ==>  T          SORT      ==>
TSTAT  ==>  SUMMARY    INTERVAL ==> 30M
```

5. Press **Enter** to validate your specifications.

These options are saved in your profile and used to initialize the fields the next time this panel is requested.

6. Press **PF3** to review the generated JCL in edit mode.

The options you specified are inserted into a pattern job DZJPTRAC in BBPROF. You may want to copy this JCL into your own UBBPROF data set and modify it.

## 7. Check the other options and add if desired; for example:

```
TSUM=T, I=30M, GRAPH=TOT
```

Add the option to graph the totals instead of printing values. There are many other options that cannot be shown on the panel. Refer to “Printing a Trace” in Volume 2 of the *MAINVIEW for DB2 User Guide*.

## 8. Submit the job.

```
COMMAND ==> SUB
```

If you prefer, you can **SAVE** or **CANCEL** the JCL.

9. Press **PF3** to return to the Batch Trace Print panel.

You can make another request now if desired.

When the job completes, review the output. This gives you a graphic summary of total DB2 activity for the selected time period in 30-minute intervals, followed by a summary of the activity.

Here is another example:

```
LTRAC ==> Y
STRAC ==> SUMMARY          (Add ,DDF if DDF is active)
```

This provides the complete DB2 Accounting information per thread. You may want to use the data selection options to limit the output.

To print an I/O report from the system I/O trace log or from an SMF/GTF data set that has DB2 I/O IFCIDs 6 - 10:

```
DBIO=X      Summarize by database/table space
DBIO=XP     Summarize by database/table space/plan
DBIO=PX     Summarize by plan/database/table space
```

All the other summarization options of AUTHID, connect, buffer pool, location, and time are also available.

---

## Chapter 6. Using RxD2 with MAINVIEW for DB2

In this practice session, you

1. Learn how to use RxD2/FlexTools with MAINVIEW for DB2 for SQL prototyping.
2. Access DB2 Catalog and PLAN\_TABLE information or invoke EXPLAIN directly from your terminal session for either local or remote DB2 systems (remote access is through DDF connections from a local DB2).

**Note:** This practice session takes approximately one hour to complete.

## Improve Performance with SQL Prototyping

SQL prototyping can be a valuable tuning exercise at two different times in the development cycle:

- When an application is first being developed and the basic performance characteristics of the SQL statements need to be validated against the design criteria.
- When a poorly performing SQL statement has been identified in an application and improvements are being sought.

RxD2 FlexTools provides a simple method both to execute and EXPLAIN SQL statements directly from the program source. There are often several possible methods to code an SQL statement, and the trick is to find the one with the best performance characteristics. Modifying and executing these variations while running a detail trace can simplify this task and document the results for you.

Begin by ensuring that RxD2 is accessible from your terminal session:

**Note:** You can access RxD2 only from a terminal session running under ISPF or MAINVIEW Alternate Access. Also, to run this scenario, your terminal session must be on the same MVS system as your source libraries and the DB2 system.

1. Go to the MAINVIEW for DB2 Primary Option Menu.

You will see an RX option in the middle of the panel if RxD2 is installed.

2. Request this option:

```
OPTION ==> RX           RxD2 FlexTools
```

The RxD2 Primary Option Menu is displayed, as shown in [Figure 113](#).

***RX Is  
Available***

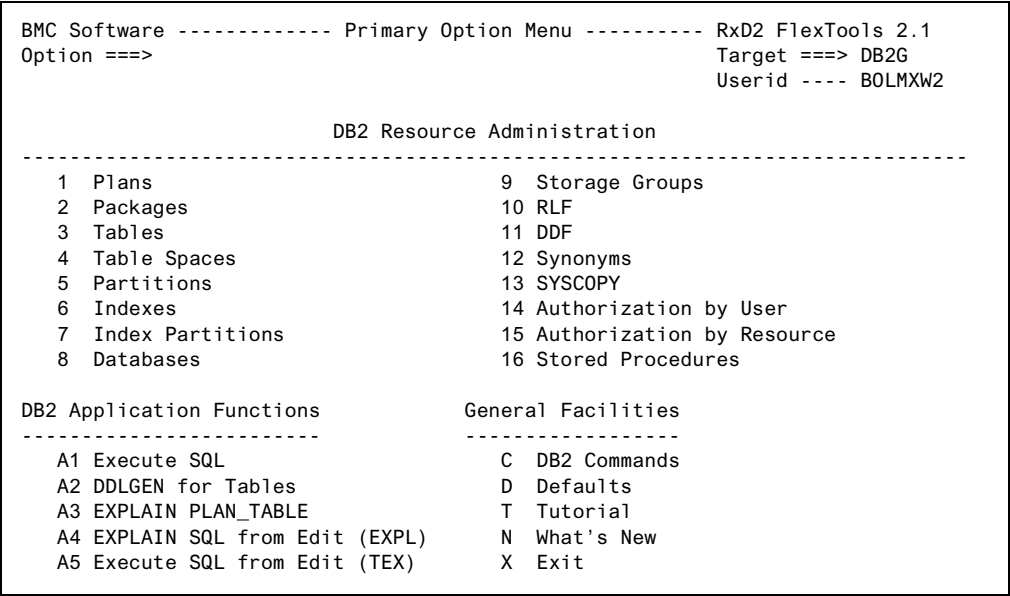

Figure 113. RxD2 Primary Option Menu

3. Press **PF3** to return to MAINVIEW for DB2.

When RxD2 is installed, you will also see a short message RX AVAILABLE at the top right of many other displays.

## Start a Trace

To set up the trace for your tests:

1. Start a detail trace qualified by your AUTHID.

```
OPTION ===> ST          Start Trace
```

The default for a detail trace includes an SQL trace, which is usually sufficient information. If you also need to analyze data access by table space, you may want to add SCANS or I/O. Include LOCKS only for specific lock analysis, since this is very expensive. Log the trace so you can print reports later if desired.

If you have any questions about starting a trace request, go back through the first part of the practice session in [Chapter 4, “Tuning an Application with Trace”](#) on page 65.

2. Check that the trace has started correctly.

```
OPTION ==> CT          Current Traces
```

Press **Enter** until your trace request appears in the list and shows as active.

Test a Statement

To start testing:

- 1. From the Primary Option Menu, or any command line, select RxD2.

OPTION ==> **RX**            RxD2 FlexTools

or

COMMAND ==> **RX**            RxD2 FlexTools

- 2. Enter ISPF/PDF Edit.

OPTION ==> **A5**            Execute SQL from Edit (TEX)

- 3. Select your program source file and member in the normal way, and then locate the statement you want to test.

(If you have the DB2 IVP installed, you can use the DSNNSAMP member DSN8MCA and choose the first statement.) (Use FIND 'EXEC SQL'.)

- 4. Choose the statement for execution.

COMMAND ==> **TEX**

Place the cursor on the statement text and press **Enter**.

If you execute this from a library with an unknown source type (for example DSNNSAMP), you are asked to define whether the text is in COBOL, PL/I, and so on. Otherwise, the statement is parsed immediately and primed in a panel to prepare for execution, as shown in [Figure 114](#).

Initiate  
Execution

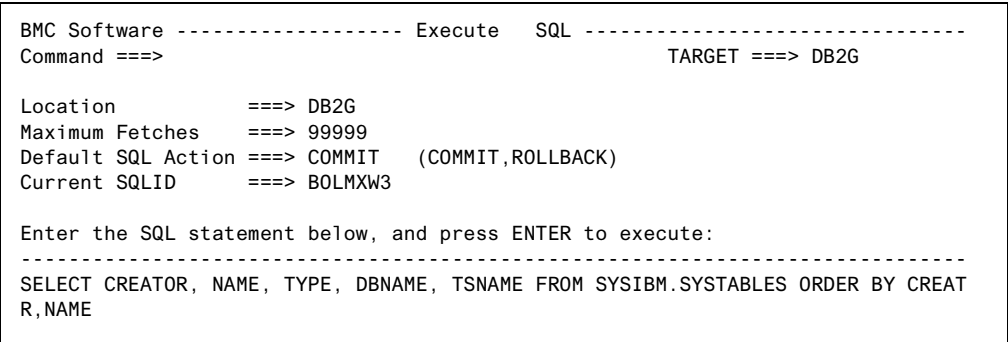

Figure 114. Execute SQL Panel

- 5. Determine the maximum number of FETCHes that should be executed.

MAXIMUM FETCHES ==> **20**

The default is 20. If you change it here, it affects only this one execution. You also can change the default in the Defaults option (RxD2/FlexTools Primary Option Menu).

- 6. Define whether you want to COMMIT or ROLLBACK.

DEFAULT SQL ACTION ==> **COMMIT**

The default is COMMIT. In both cases, the thread is terminated at completion so that an accounting record is cut for each execution.

7. Modify the SQL text if necessary.

Review and modify the SQL statement text before execution as dynamic SQL. Host variables are not supported (they are replaced by question marks in the text), so you may have to edit in appropriate values for the test. You also can delete or add clauses. It is not necessary to edit out blanks. The text will be flowed together for execution.

8. Change the current SQLID if necessary to qualify a table name or edit it into the text.

9. Press **Enter** to submit the SQL statement for execution.

Output is returned in a scrollable display, each row separated by asterisks and the row number, followed by one line per column, as shown in [Figure 115](#).

### Results of Execution

```

BMC Software ----- Execute SQL Output ---- Row 145 to 180 of 1,174

```

Figure 115. Execute SQL Output Panel

10. Repeat the modification and execution of the statement for as many iterations as you need.

11. Press **PF3** to return to your edit session.

If you wish, you can now choose another SQL statement to test.

EXPLAIN a Statement

You can EXPLAIN any statement while in edit. This can be very useful when you are first creating an SQL statement. You do not need to EXPLAIN every iteration you are testing now, since the MAINVIEW for DB2 trace captures the EXPLAIN data created for the dynamic SQL. Choose one to try out now so you know how it works:

- 1. Choose the statement for execution.

COMMAND ==> **EXPL**

Place the cursor on the statement text and press **Enter**.

You may be asked to define the source type, just as for TEX. Then the statement is parsed and primed in a panel to prepare for EXPLAIN, as shown in [Figure 116](#).

**Note:** You must have a PLAN\_TABLE allocated for your AUTHID or, if changed, the current SQLID.

*Initiate  
EXPLAIN*

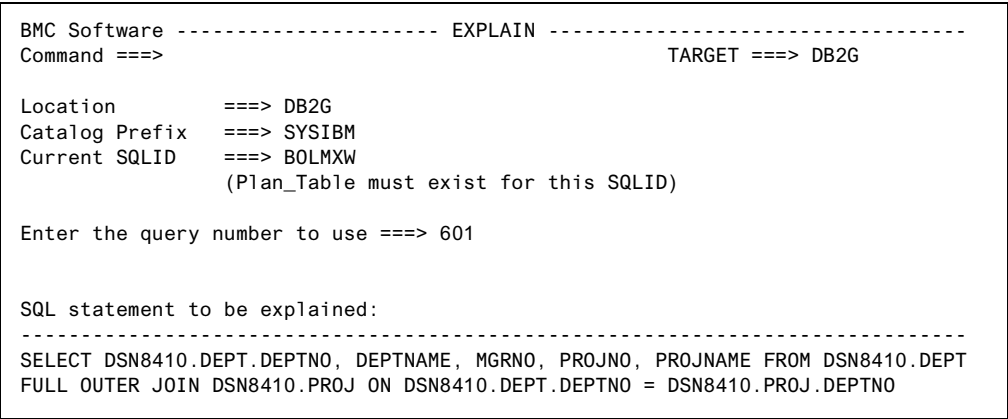

Figure 116. EXPLAIN PLAN\_TABLE Qualifier Panel

- 2. Specify the query number to identify this iteration.

Type the query number to use ==> **1**

The default is 1.

Review / modify the SQL statement text before EXPLAINing it. Host variables are replaced with parameter markers (questions marks) in a format acceptable to EXPLAIN.

3. Press **Enter** to submit the SQL statement to be EXPLAINED.

The EXPLAIN output is returned in a formatted, scrollable display, as shown in [Figure 117](#).

*Results of  
EXPLAIN*

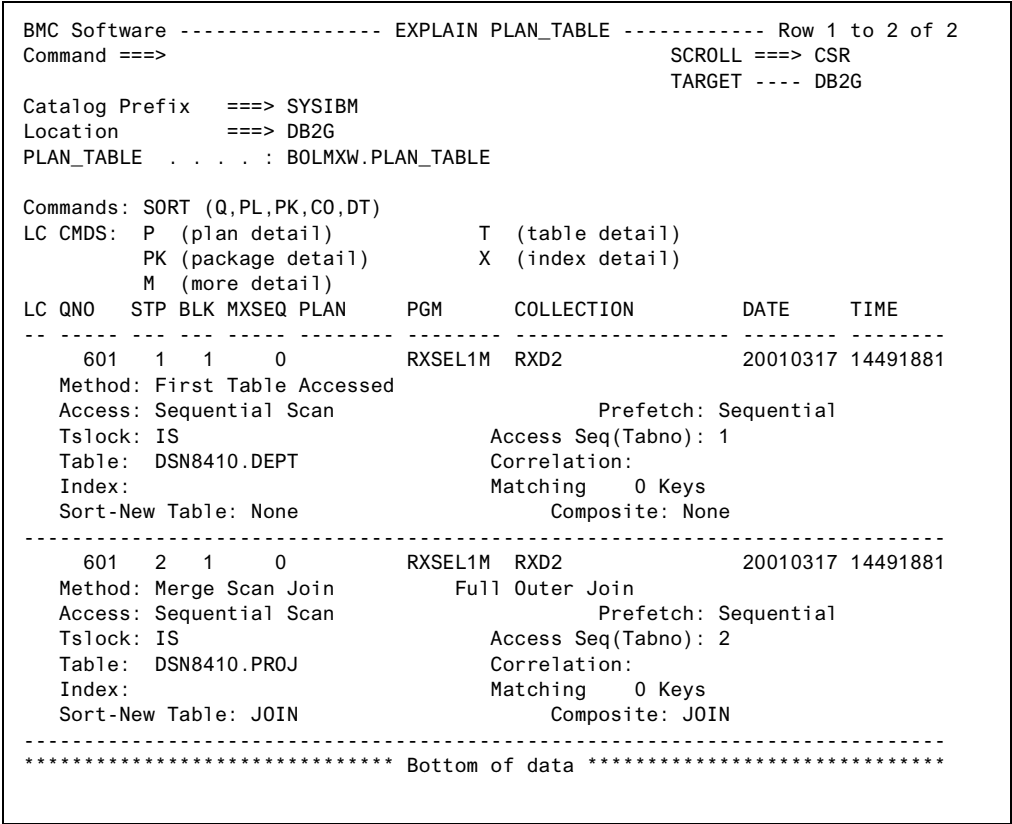

Figure 117. EXPLAIN PLAN\_TABLE Output Panel

4. Most of the important information is available on this first display, but you can use line command **M** to see more detail.

5. Use the line commands to quickly access information about the DB2 objects accessed.

- LC (Line Command)
- T (for Table detail)
- X (for Index detail)

All table/index catalog information upon which DB2 bases its access path selection is easily found with these dialogs.

6. Repeat the modification and EXPLAIN of the statement for as many iterations as you need.

7. Press **PF3** to return to your edit session.

If you wish, you can now choose another SQL statement.

## Compare Test Results

To find out which of the test SQL versions ran best:

- 1. From edit, press **PF3** several times to return to MAINVIEW for DB2.
- 2. Look at your trace data.

OPTION ==> 5      HISTORY      Historical Trace Data Sets

If you logged the trace, locate your data set here (SORT US, then LOCATE userid).

If not, go to Option 4, Current Traces.

- 3. Select the trace for viewing.

LC            (Line Command)  
S            (S to select the trace data)

The first display (LTRAC) lists one line for each test execution (and DB2 accounting record). You can see immediately which test executions had the best performance as measured by elapsed and CPU times, as well as number of GETPAGEs.

- 4. Select one line for further analysis by tabbing to that line and pressing **Enter**.

You now have the complete DB2 Accounting information at your finger tips (STRAC). This provides you with statistics on wait times, locking, buffer pool activity, and I/O.

- 5. To compare this data to that from another iteration, use **PF10** and **PF11** to move to previous or next accounting record displays, without returning to the LTRAC list.
- 6. Tab through the expand buttons and press **Enter** to view summaries of SQL statistics, scans, I/O, or locks by table space (if traced).
- 7. To identify which SQL statement text was executed for this test iteration, tab to the **DETAIL** expand button and press **Enter**.

You are now viewing a chronological list of detailed events that occurred in DB2 while processing this statement (DTRAC display).

For dynamic SQL, this provides you with critical data to help you relate the performance data in the trace with the test SQL you executed.

- 8. Tab to the **BIND-TEXT** event and press **Enter** to see the complete text of the SQL statement executed, as shown in [Figure 118](#).

*Complete Text*

Figure 120. DTRAC EXPLAIN Pop-Up Display for DB2 4.1 and 3.1

If you need to review the catalog information, the **EXPLAIN** expand button takes you back to RxD2 to a display of the first table accessed.

11. If needed, tab to any SQL statement and press **Enter** to see the detail row statistics.

This can show you how many rows were accessed and whether the predicate was Stage 1 or 2.

12. Tab to the **LOCK SUMMARY** event to see an analysis of locking and lock states (tracing lock events is not necessary to get this).
13. As with STRAC, you can use **PF10** and **PF11** to move between the events produced by this test iteration.

## Print Results

If you logged the trace, you may now want to print a report for desk analysis or a team SQL review:

1. Press **PF3** until you are back in the History Traces display.
2. Select the print option for your log data set.

LC     (Line Command)  
P     (for Print)

A panel on which you can define your print options is displayed. For more details, refer to [“Print a Trace Report” on page 94](#).

Recommended print options for SQL prototyping are

LTRAC=Y	One line identifier
STRAC=SUMMARY	DB2 accounting record summary
DTRAC=Y	Detail events
POPUP=(BIND-TEXT,EXPLAIN)	SQL text and EXPLAIN data

You may want to add

NEWPAGE=TRAN	Start a new page per test execution
LEVEL=3	To see all detail events

You may also want to print the detail summaries of STRAC in a separate report (they cannot be produced in the same report with DTRAC entries).

LTRAC=Y	One line identifier
STRAC=ALL	Complete accounting with detail summaries

---

## Access DB2 Catalog and PLAN\_TABLE Information

DB2 performance is dependent on three factors:

- How the DB2 system is configured (maximum threads, buffer pool, EDM pool, logging, and so on)
- The DB2 workload (SQL optimization, lock contention, I/O patterns, and service times, and so on)
- The DB2 objects themselves (tables, table spaces, indexes, plans) and the status information stored in the DB2 catalog about them

MAINVIEW for DB2 and other performance monitors mainly present data about the first two categories. Catalog and PLAN\_TABLE access is usually a completely separate function. The ability to access RxD2/FlexTools directly from your BBI Terminal Session provides this information whenever you need it (subject to standard DB2 security).

## Accessing the RxD2 Primary Option Menu

Access to DB2 data with RxD2 is provided from any MAINVIEW product that runs in full-screen mode, not just MAINVIEW for DB2. This includes

- AutoOPERATOR and FOCAL POINT—an operator or systems programmer can check the status of DB2 resources that may be affecting availability
- MAINVIEW for CICS—a CICS systems programmer or applications manager can investigate plans and tables used from CICS
- MAINVIEW for IMS—an IMS systems programmer or DBA can investigate plans and tables used from IMS

As described in the first session, the RxD2/FlexTools Primary Option Menu is available from most MAINVIEW applications running in full-screen mode.

- From the MAINVIEW for DB2 Primary Option Menu:

```
OPTION ==> RX
```

- From any command line:

```
COMMAND ==> RX
```

- From any MAINVIEW for DB2 or MAINVIEW for IMS service display:

```
SERV ==> RX
```

Now all the capabilities of RxD2 are available for use.

Accessing EXPLAIN for Currently Executing SQL

When a DB2 application is running too long, you may want to investigate the current SQL statement being executed. The MAINVIEW for DB2 detail user (DUSER) display provides hyperlink expand buttons to perform an EXPLAIN or access existing PLAN\_TABLE EXPLAIN data.

To access EXPLAIN data for currently executing SQL:

- 1. Access the DUSER display:
  - a. Return to the Primary Option Menu.
  - b. Choose Option 2—ANALYZERS.
  - c. Line select **USERS** from the list of Analyzer Display Services.
  - d. Tab to an active thread and press **Enter** to access DUSER.

Check that there is an active SQL statement displayed, as shown in [Figure 121](#).

Expand to  
EXPLAIN ==>

Current SQL  
Statement ==>

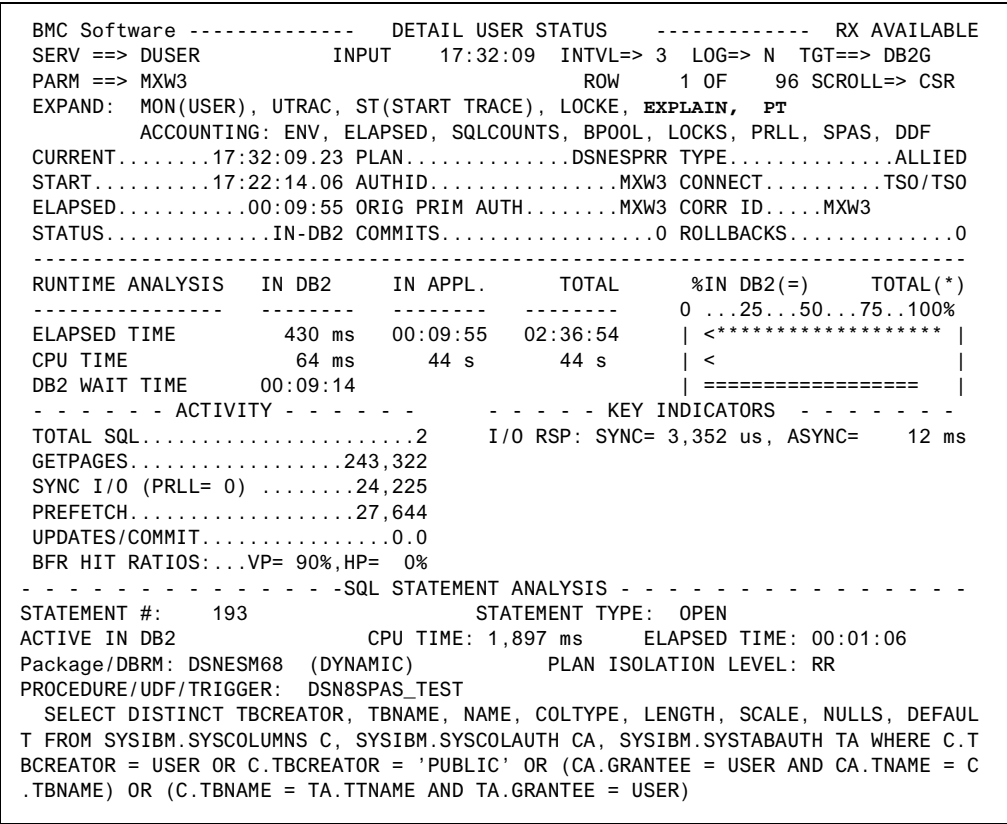

Figure 121. User Detail Status Display (DUSER)—Base Section

- 2. Select the **EXPLAIN** expand button.

A qualifier panel is displayed with the SQL text from DUSER.

If the DB2 target is on the same MVS as your terminal session, Rx2D2 accesses it directly (see the TARGET field). If the DB2 target is on a remote MVS, Rx2D2 accesses it through DDF. The TARGET name shown now is the local DB2 your Rx2D2 session is connected to (set in the Defaults panel) and LOCATION identifies the remote DB2.

3. If necessary, modify the query number and PLAN\_TABLE owner (current SQLID).

Enter the query number to use ==> 1  
Current SQLID ==> your userid

**Note:** If your SQL has unqualified table names, you may need to set up special PLAN\_TABLEs with the appropriate prefixes so that the current SQLID also can provide the proper table name qualifications.

4. Press **Enter** to invoke EXPLAIN, as shown in Figure 122.

**EXPLAIN  
Output  
for Current  
SQL Statement**

```

BMC Software ----- EXPLAIN PLAN_TABLE ----- Row 1 to 2 of 2
Command ==>
                                         SCROLL ==> CSR
                                         TARGET ---- DB2G

Catalog Prefix ==> SYSIBM
Location ==> DB2G
PLAN_TABLE . . . . : BOLMXW.PLAN_TABLE

-----
***** Bottom of data *****

```

Figure 122. EXPLAIN PLAN\_TABLE Output Panel

This option can be used for both static and dynamic SQL. However, for static SQL, the results may be different from the access path chosen by the DB2 Optimizer at BIND time.

5. Press **PF3** until you return to DUSER.  
6. If this is a static SQL statement, select the **PT** expand button.

A qualifier panel is displayed primed with the query number (statement number) and program (DBRM or package).

7. Your user ID is primed as the PLAN\_TABLE owner.

You may need to change this specification before proceeding.

8. Press **Enter** to view the PLAN\_TABLE EXPLAIN data.

## Accessing EXPLAIN from a Trace

The previous practice session, [“Improve Performance with SQL Prototyping” on page 124](#), showed how both SQL text and EXPLAIN information is captured in a detail trace for dynamic SQL. Neither of these events is provided by DB2 for static SQL. However, direct hyperlinks to RxD2 provide equivalent information.

To access EXPLAIN data from a trace:

1. Access a detail trace that includes static SQL:
  - a. From the Primary Option Menu, choose Option **4**—Current Traces (or Option **5**—History Traces, if you prefer).
  - b. Line select the detail trace to view the LTRAC display of traced threads.
  - c. Tab to a trace entry with several SQL statements and press **Enter** to see the accounting data for that thread (STRAC display).

2. Select the SQL Summary section by tabbing to the **SQL** button in the SUMMARIES EXPAND line and pressing **Enter**.

A summary of all SQL executed by that thread is displayed, as shown in [Figure 123](#).

### SQL Summary

```

Figure 124. SQL Statement Pop-Up Display (STRAC)

4. Tab to the **SQLTEXT(EXPLAIN)** expand button and press **Enter**.

**Note:** If this statement is not static SQL, the button is not highlighted. Try another statement.

This displays the complete static SQL statement text from the appropriate plan or package catalog table. From this panel, you can choose to

- Access existing EXPLAIN data in a PLAN\_TABLE  
Your user ID is primed as the PLAN\_TABLE owner. You can change it before making the request.
- EXPLAIN the text and access the RxD2 EXPLAIN display for the statement (although this may not show the access path actually used that was chosen at BIND time)

A qualifier panel is first displayed primed with the SQL text and query number 1. Your user ID is primed as the PLAN\_TABLE owner. You can change these specifications before executing the EXPLAIN. If any host variables are in the statement, they are replaced by parameter markers (question marks) to make it EXPLAINable.

- Execute the statement

You can specify the maximum number of fetches, whether to COMMIT or ROLLBACK, and change the SQLID if necessary before execution.

If any host variables are in the statement, they are replaced by question marks, and the text is presented on the Execute SQL panel to allow for tailoring into an executable format.

**Note:** The same panels you have viewed previously for the RxD2 EXPLAIN are shown.

*Detail  
Events*

5. Press **PF3** to return to STRAC.
6. Select the **DETAIL** expand button to view the detail events that occurred within the life of the thread, as shown in [Figure 125](#).

BMC Software -----			DETAIL TRACE ENTRY -----			-----PERFORMANCE MGMT

Figure 125. Detail Trace Events (DTRAC)

7. Scroll down with **PF8** until you see a static SQL statement and select it to view the SQL statement pop-up display.

This looks much like the one you saw from the SQL Summary, but is only for one execution of that statement.

The same SQLTEXT(EXPLAIN) expand button is available here.

8. Press **PF3** until you return to the Primary Option Menu.

## Accessing Other Catalog Data with Direct Hyperlinks

Analyzer displays of DB2 database objects (DBATs and DBTS), as well as the detail trace dynamic SQL EXPLAIN pop-up display, provide direct hyperlinks to the related catalog information on selected objects.

To hyperlink directly to related catalog data:

1. From the Primary Option Menu, select Option **7**—I/O Analysis and then select Option **1**— I/O by DB/TS.
  2. Line select one of the table spaces.
- DBIOD—I/O Analysis by Data Set is displayed and the parameter field is primed with the name of the selected database and table space, as shown in [Figure 126](#).

*Selected

                                Press ENTER to process, END to exit

```

Figure 128. Table Space Qualifier Panel

For example, in the DBNAME field, type **DSN\*** to display all system table spaces.

**Note:** When you are finished with this exercise, press **PF3** several times to exit the EXPLAIN function. You can initiate the next exercise from any MAINVIEW for DB2 service.

## Accessing Specific Objects in the Catalog

At other times, you may need information about a specific DB2 object or user that is being shown on a display of one of the BBI products. For example, you might be on a tabular display like LTRAC where a direct hyperlink is not available. Instead of writing the name down on a piece of paper to later type in a selection panel, the BBI—RxD2 interface provides subcommands that prompt you for immediate entry of the object name. If you decide not to type the name, you are presented with a qualifier panel that allows you to select a list of these objects.

To view details about a specific plan:

1. Type

```
COMMAND ==> RX PL planname
```

If you are in a display with a COMMAND line (for example, when viewing a DB2 message in the Log Display), you can type the plan name directly after PL on the COMMAND line.

If you are in a display with a SERV line, just type **RX PL** and press **Enter**. You are prompted at the bottom of the screen for the plan name (for example, in the STRAC trace display).

2. Press **Enter** to go to RxD2.

The TARGET is set to the local DB2 from your Defaults panel.

To access a different DB2 system on the same MVS as your terminal session, specify the correct **target name** on the qualifier panel. To access a remote DB2 system (if connected with DDF), keep the TARGET pointing to any local DB2 and specify the **location name** of the remote DB2. You also can change the catalog prefix to view an alternate catalog.

3. If you specify a plan name, RxD2 displays the DB2 Plan Administration panel with one line of information about that plan, as shown in [Figure 129](#).

**Information  
for One Plan**

```

BMC Software ----- DB2 Plan Administration ----- Row 1 to 1 of 1
Command ==>
                                SCROLL ==> CSR
                                TARGET ---- DB2G

Location      ==> NEW YORK
Catalog Prefix ==> SYSIBM

COMMANDS: SORT (column no.)
LC CMDS:  A (plan authorization)      F (free plan)
          B (bind plan functions)     P (show plan detail)
          C (list plan collections)   R (rebind plan)
          D (show plan dependencies)  S (show DBRMs and SQL statements)

          -STATUS--
LC PLANNAME VALD OPER CREATOR  BOUND BY  DATE    TIME    ISOL VALD ACQ  REL
-----
DSNST01  Y    Y    BOLSMR2  BOLSMR2  950817  15353898  CS   DFER USE  COMMIT
*****
                                BOTTOM OF DATA *****

```

Figure 129. DB2 Plan Administration Panel

All the line commands are available to access more detailed information.

```

LC      (Line Command)
A      (to show plan authorizations)
C      (to list plan collections)
D      (to show plan dependencies)
P      (to show plan detail)
S      (to show DBRMs and SQL statements)

```

For example, you may need to see the plan dependencies or authorizations to find out why an application isn't running.

The plan detail and static SQL statement text are valuable when analyzing a detail trace for application tuning.

4. To view the EXPLAIN results for a specific plan:

```
COMMAND ==>> RX PT planname (owner)
```

If you don't enter the operands, you are prompted at the bottom of the screen. You can specify the PLAN\_TABLE owner, or default to your user ID.

The EXPLAIN results are displayed on a panel from which catalog data about the accessed tables and indexes can be accessed directly.

```
LC      (Line Command)
P      (to show plan detail)
T      (to show table detail)
X      (to show index detail)
```

For example, use this command when investigating a production plan that has been showing up in exception reports with increased run times. All the dependencies and statistics are available starting from this one screen, as shown in [Figure 130](#).

**EXPLAIN  
Results  
for One Plan**

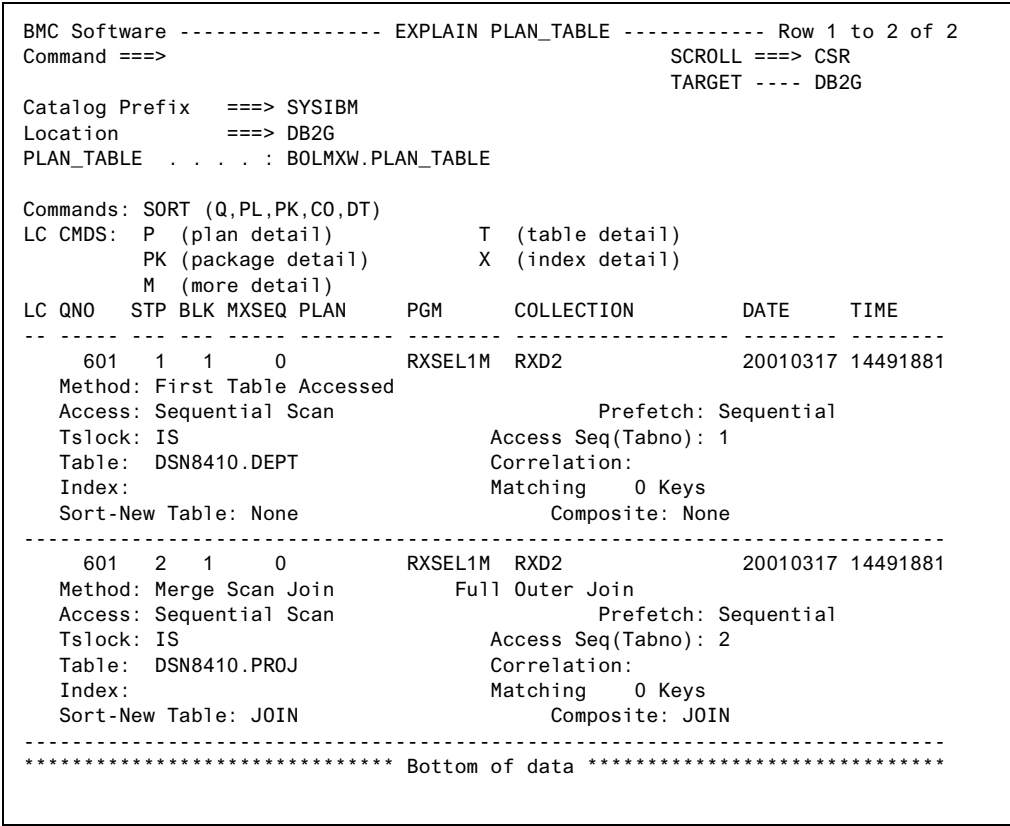

Figure 130. EXPLAIN PLAN\_TABLE Output Panel

5. To view the details about a specific table:

```
COMMAND ==> RX TB tablename | OBID
```

If you don't enter the operand, you are prompted at the bottom of the screen. You can specify either the table name or OBID.

6. If you specify a table name, RxD2 displays the Show Table Objects panel, as shown in [Figure 131](#).

**Information  
for One Table**

BMC Software ----- Show Table Objects -----

```
LC      (Line Command)
I       (to show index parts)
K       (to show index key columns)
```

---

## Chapter 7. Printing Reports

These scenarios teach you how to print both your online and offline reports.

In this practice session, you

1. Print an online history trace and export an online windows-mode view for offline review.
2. Print offline traces from a trace log data set or SMF records.
3. Print offline Performance Reporter reports from SMF data, MVDB2/DC archive data sets, and DB2 tables.

This practice session takes approximately one hour to complete.

---

## Print Online Reports

You can both print online history traces and export online windows-mode views for offline review.

### History Traces (Thread Data)

In previous exercises, you learned how to run a trace and view it online. However, depending on the results, you may want to have a hardcopy for further analysis. Batch reports can also be valuable tools during an application review meeting.

**Note:** This section describes printing a trace, but you may also want to look at the accounting reports produced from DB2 trace records written to SMF, from MVDB2/DC archive data sets, or from DB2 tables loaded from one of these sources. See [“Performance Reporter Reports” on page 160](#) and the *MAINVIEW for DB2 Performance Reporter User Guide* for more information.

To begin this exercise:

1. From the Primary Option Menu, select the **HISTORY TRACES** option.

```
OPTION ===> 5
```

This panel not only provides access to view the trace data online but also offers several line commands to simplify management of the trace log data sets:

<b>W</b>	Show the options used for this trace
<b>P</b>	Generate the JCL to print a batch report
<b>D</b>	Delete this data set from the trace directory
<b>E</b>	Reset the log data set for reuse
<b>V</b>	Verify that the directory entry matches the data set contents
<b>N</b>	Add a new data set to the directory (moved from another system)
<b>A</b>	Archive the data set (only if an archive started task was specified)
<b>F</b>	Free a data set currently being read

Usually you will need only W(SHOW), D(DELETE), and P(PRINT). We are going to concentrate now on P. You can try the others when you need those functions.

## All Data per Traced Thread

To print a trace report showing all data per traced thread:

1. The history traces display shows the most recent traces at the top, but you can sort on any column and use the locate command to help you find other trace logs. For example, you can sort on userid to group all your own trace logs together.

Now, select your trace log data set for print.

```
LC      (Line Command)
P      (for PRINT)
```

The Batch Trace Print panel is displayed, as shown in [Figure 133](#), where you can specify options to print a batch report.

### Printing a Trace

```

BMC Software ----- BATCH TRACE PRINT ----- PERFORMANCE MGMT
COMMAND ==>                                     TIME --- 15:00

Update job ==> N (Y/N - update job statement)          (END to edit JCL)
Title line 1 ==>
Title line 2 ==>

CONNECT   ==>
CORR      ==>
LOC       ==>
DB2PKG    ==>

REPORT SELECTION:
LTRAC ==> NO                      (YES/NO)
STRAC ==> NO                      (NO,ALL,SUMMARY,section1,section2..)
DTRAC ==> NO                      (YES/NO)
POPUP ==> NO                      (NO/ALL/SQL/event1,event2,...)
TSUM  ==>                        (A/C/L/P/T)   SORT ==>      (for any TSUMx)
TSTAT ==> NO                     (SUMMARY/ALL/NO) INTERVAL ==> 1H   (for TSUMT only)
DBIO  ==>                        (X/A/C/F/L/P/T/xx) IOSORT ==>    (for any DBIOx)
                                           IOINTVL ==> 10M   (for DBIOT only)

```

Figure 133. Batch Trace Print Panel

2. If this is your first time using this option, you must update your job statements.

```
Update Job ==> Y
```

3. Press **Enter** to display a job statement data entry panel.

Fill in the required information and return using **PF3**.

4. Set the Update Job option to **N**.

5. Fill in the options for a report.

```

TITLE1 ==> any title   Optional. Centered in first report header.
TITLE2 ==> any title   Optional. Centered in second report header.

```

Data Selection is optional. The selection fields can be used to reduce the amount printed from a long trace.

Data Selection:

```
From date ==> ddmmmyyyy Time ==> hhmm
To date ==> ddmmmyyyy Time ==> hhmm
```

The date and time fields are primed with the start and end date-time of the trace. You can modify them to select a shorter time period.

```
PLAN ==> plan name
AUTHID ==> authorization id
CONNECT ==> connection name
CORR ==> correlation id
LOC ==> location name
DB2PKG ==> db2 package name
```

The Data Selection identifiers allow you to select only a subset of threads that you need to analyze further, such as one particular plan from a Thread History (THRDHIST) trace.

REPORT SELECTION:

```
LTRAC ==> N
STRAC ==> ALL Print data per thread traced.
DTRAC ==> N
POPUP ==> N
TSUM ==>
TSTAT ==> N
DBIO ==>
```

There are many different reports that can be generated, either singly or combined. See [“Batch Trace Print” on page 155](#) for some examples. Browse “Printing a Trace” in Volume 2 of the *MAINVIEW for DB2 User Guide* for a full explanation of the options and to see sample reports.

The reports are based on printouts of the online displays, so the options are selected using the names of these displays, like LTRAC, STRAC, DTRAC. In this tutorial we have chosen **STRAC=ALL** as the most useful report for application tuning. It shows the following for each thread traced:

- Basic **DB2 accounting record** data
- **Environmental Indicators** section
- **Elapsed Time Analysis** section
- **SQL Statement Execution Counts** section
- **Buffer Pool Usage Analysis** section, including Global Buffer Pools
- **Lock Activity** section, including Global Locks
- **I/O Parallelism** section
- **Routines** section (stored procedures and user-defined functions)
- **DDF Summary** section (if distributed work was done)
- **Package/DBRM Overview** section (if accounting trace 7 is active)

These sections are included for detail traces that captured the relevant events:

- **SQL Summary** section with summary statistics per SQL statement (SQL events)
- **Database Summary** section with scans per page set (SCAN events)
- **Database Lock and I/O** section with locks and I/O data per page set (I/O or lock events)
- **Sort Summary** section (if any sorts were performed) (any detail trace)

6. Press **Enter** to validate your specifications.

These options are saved in your profile and used to initialize the fields the next time this panel is requested.

**Note:** Be careful! Select only the data you want to print. This report is per thread execution (like an accounting trace report from DB2PM) and can generate a large amount of output.

7. Press **PF3** to review the generated JCL in edit mode.

The options you specified are inserted into a pattern job DZJPTRAC in BBPROF. You may want to copy this JCL into your own UBBPROF profile data set and modify it.

8. Review the remaining options.

There are many more print options than can be shown on the panel, such as lines per page or maximum pages to print. The sample job contains a short description of these options. Scroll to the bottom to review them.

9. Submit the job.

COMMAND ==> **SUB**

Of course, if you prefer, you can **SAVE** the JCL for later execution, or even **CANCEL** it completely.

10. When the job is completed, review the output.

11. Press **PF3** to return to the Batch Trace Print panel. You can issue another request now if desired.

## Other Accounting Report Examples

Here are a few examples of workload-oriented reports based on the DB2 accounting record. For quick reports submitted online through the trace print panel, you will generally select one of the trace logs created by the Thread History (THRDHIST) trace for the time period you are interested in. However, these same accounting reports can be produced from any other summary or detail trace log. See [“Print Offline Reports” on page 155](#) for more complete batch reporting options.

- For a summary of total DB2 activity for the selected time period, you can first select an overview summary by time (broken into 30 minute intervals in this example), followed by a summary of all accounting data with useful averages, totals, and maximums for the complete period.

```
TSUM ==>T
TSTAT==>SUMMARY          INTERVAL==>30M
```

- To change the summary to a graphic format, edit the generated selection statements in the JCL before submitting the job:

```
TSUM=T, I=30M, GRAPH=TOT (or AVG)
```

- For a summary by plan (or other identifier), specify

```
TSUM=P          (or A for authorization ID, and so on)
```

All the other summarization options of AUTHID, connect, buffer pool, location, and time are also available.

- For a quick list of each thread, specify

```
LTRAC==>Y
```

- To generate a report of activity in each individual buffer pool per thread, specify

```
STRAC==>BPOOL
```

For a summary of this information per individual buffer pool for all selected threads, look at this same section in the TSTAT SUMMARY report mentioned above.

## Other Detail Trace Report Examples

You may want to try other report combinations too. Here are a few examples from detail traces:

- For an SQL statement summary per thread, sorted by Average CPU usage, followed by average SQL row processing statistics per statement:

```
LTRAC ==> Y
STRAC ==> SQL, SORTSQL=AC, SQLPOPUP
```

- For a detail event trace per thread, with pop-up displays per SQL statement:

```
LTRAC ==> Y
DTRAC ==> Y
POPUP ==> SQL
```

- For SQL statement text and EXPLAIN data for all dynamic SQL executed or BINDs of static SQL:

```
POPUP ==> (BIND-TEXT, EXPLAIN)
```

- For a summary of I/O counts and wait times per database, table space, and plan (from an I/O trace):

```
DBIO ==> XP
```

- To summarize by plan, database, and table space:

```
DBIO ==> PX
```

You can adjust many formatting options:

<b>NEWPAGE</b>	Control page breaks
<b>WIDTH</b>	Specify wide (133) or narrow (81) output
<b>LINECNT</b>	Adjust the number of lines printed per page
<b>HEADING</b>	Suppress headings
<b>MAXPAGES</b>	Limit the amount of output to prevent an unexpectedly high print volume

## Online Views

You can export any windows-mode view to a data set or print it to a SYSOUT class using the **EXPort** command. The exported view can be used to supplement performance reports or can be downloaded to a workstation for use with a spreadsheet application.

When you enter the **EXPort** command, a panel is displayed requesting an existing data set name (or SYSOUT class) and formatting options, as shown in [Figure 134](#).

*Export a View  
for Printing*

----- Export Open Data Set -----  
COMMAND ==>  
  
LIBRARY (PDS):  
  Project      ==>  
  Group       ==>

  Sysout Class  ==>          If specified, overrides other data set options  
  
Press END to save changes and export report.  
Type CANCEL to return to previous panel without saving changes.

Figure 134. View Export Panel

The output of the **EXPort** command includes all the rows of data associated with the view, even data that requires scrolling to be seen online. However, if the logical record length (LRECL) of the data set is less than the width of the view, the view data is truncated on the right.

---

## Print Offline Reports

You can print

- Offline traces from a trace log data set or SMF records
- Offline Performance Reporter reports from both SMF data and DB2 tables

## Batch Trace Print

Most scheduled batch reporting is done with the Performance Reporter reports either directly from SMF data or from that same data loaded (often summarized) in DB2 tables. However, this data is often not available to answer questions about the DB2 workload until the next day. The batch trace print facility is designed to fill the need for quick reports. All the trace summary accounting report formats are available, in any combination.

There are different types of input:

- One or more trace log data sets  
For example, the Thread History trace.
- The archived trace logs (without reloading to VSAM)  
For example, thread history from two weeks ago.
- An SMF history file containing DB2 Accounting records or I/O trace IFCIDs
- The live SMF data sets
- A GTF trace data set

A batch utility job, DZTBTRAC, is provided in your BBSAMP data set to print these reports. There is also a sample JCL member DZTBPRNT you can use when you want to generate multiple reports or print accounting reports from SMF data. The control statements for several sample reports are provided in BBSAMP member DZJPnnnn, with comments to point out some of the most useful variations.

The trace data shown in the batch reports is in the same format and content as the online displays. This includes LTRAC, STRAC, DTRAC, DTRAC pop-ups, TSTAT, and the TSUMx and DBIOx series of displays. Many of these displays can also be combined into one report. For example, a report can consist of both LTRAC and DTRAC data. Selection options, such as plan, authorization ID, or date can be used to narrow the scope of a report. In addition, you can focus in on just one area of interest, such as buffer pool activity by individual pool.

All of the report options described in [“Print Online Reports” on page 148](#) are also available by directly editing and submitting the batch trace print job, first specifying the input file and the reports to be printed.

## Trace Print from a TLDS

To print a trace log data set, use the JCL provided in BBSAMP members DZTBTRAC, as shown in [Figure 135](#). Specify the DSN of the log with the TLDS parameter. Multiple TLDSs can be concatenated.

## Specify JCL Statements

---

Figure 136. Accounting Summary Report

All control of the input and formatting is done through a series of keywords in the input job stream (or in a PDS member) under ddname SYSIN. Keywords that apply to all requested reports can be specified following a label of GLOBAL. Keywords that apply to a specific report must be specified following the REPORT label. An example of two report requests is shown in [Figure 137](#).

### *Specify Request Keywords*

---

```

GLOBAL  TIME=1300-1500
*
*      BIND-TEXT and EXPLAIN FROM TSO
*
REPORT  REPORTID=DAILY1,LTRAC=YES,NEWPAGE=TRAN,
        POPUP=( BIND-TEXT,EXPLAIN,OPEN) ,
        CONNECT=TSO,
        TITLE1='DETAILS OF BIND AND EXPLAIN' ,
        TITLE2='WITH STATS FROM OPEN' ,
        DDN=OUTPUT1,WIDTH=WIDE           COMMENTS ABOUT THE REPORT
*
*      FULL EXAMINATION OF CERTAIN SPECIAL TRANSACTIONS
*
REPORT  REPORTID=SPECIALS,LTRAC=YES,STRAC=SUMMARY,DTRAC=YES,POPUP=ALL,
        NEWPAGE=( TRAN,FIRSTEVENT) ,LEVEL=3 ,
        PLAN=( PAY+++++,ACCT1+++ ) ,CONNECT=IMSP ,
        AUTHID=( USR1,USR5 )

```

---

Figure 137. Sample Report Requests

The GLOBAL keyword TIME limits the trace output to 1pm to 3pm for both reports.

The first report prints the one-line LTRAC entry on a new page for each transaction of the selected TSO threads and the pop-ups for BIND-TEXT, EXPLAIN, and OPEN after that one-line entry for each transaction. The report is written on ddname OUTPUT1.

The second report prints the one-line LTRAC entry, the STRAC accounting summary, and all DTRAC events and pop-ups for selected plans from two specific IMS users. The report is written on ddname SPECIALS.

For detailed information about each of the request keywords you can use, see “Printing a Trace” in Volume 2 of the *MAINVIEW for DB2 User Guide*.

## Trace Print from SMF Records

This same batch utility (DZTBTRAC), shown in [Figure 135 on page 156](#), can be used to print summary trace reports from DB2 accounting records written to GTF or SMF, either from an SMF history tape or from the live SMF data sets.

In addition, the following I/O analysis reports can be produced from an SMF or GTF file that includes the I/O trace records (IFCIDs 06-10):

DBIO=X

I/O analysis by database and table space

**Note:** This report can be summarized by many different summary key combinations, such as plan, database, table space or database, table space, plan. See “Special Report Summarization Options for DBIO” in Volume 2 of the *MAINVIEW for DB2 User Guide* for examples.

DBIO=A

I/O analysis by AUTHID

DBIO=C

I/O analysis by connection name

DBIO=F

I/O analysis by buffer pool

DBIO=L

I/O analysis by location

DBIO=P

I/O analysis by plan

DBIO=T

I/O analysis by time interval

**Note:** Other detail trace events are not extracted from SMF or GTF. In addition, you cannot process SMF or GTF files in the same run with TLDSs.

## Performance Reporter Reports

Performance Reporter is an offline analysis system that produces reports that can be used to evaluate DB2 system and application performance. These evaluations can be used for DB2 planning, forecasting, and performance management.

Several reports can be produced from Data Collector archive data sets or SMF extract files without loading the data into DB2 tables. For longer term storage and trend reporting, summarized data can be loaded to the performance data tables.

Also, the accounting data supports several levels of summarization. You can print any number of reports produced from the summary and detailed accounting tables, or statistics, buffer statistics per pool, and audit tables. Additional reports are available from the Data Collector, such as a storage report from IFCID 225.

When you want reports produced directly from the input data, and only the reports are needed, it is recommended that you use the Data Collector reports. If you are also loading data into tables, consider the Reports from SMF so that you extract the data only once.

### Data Collector Reports

These reports can cover one day, several days, or just a short recent interval, depending on the number of archive files used as input. For immediate reporting, you can produce reports from the active Data Collector trace data sets.

You can review the available archive trace data sets from the Data Collector Administration panel (hyperlink from EZDB2), option D, Archive Directory.

Reports on accounting, statistics and audit data are available, as well as a DBM1 storage usage report (IFCID 225) and utility processing (IFCIDs 23-25).

### Reports from SMF

Selective or total accounting reports, in either a short or a long format, can be printed from DB2 accounting records extracted from one or more SMF files. For example, you can select from a specific time period or by plan, authorization ID, and so on. The reports also can be summarized by various criteria.

Use the DPREPORT batch job to print accounting or statistics reports, in either a short or a long format. [Figure 138 on page 161](#) shows sample job control statements for producing an accounting long report ordered by primary authorization ID and plan name, summarized in 8-hour intervals.

**Specify Job  
Control  
Statements**

---

```
//DPRACCT JOB
//*-----
//*          JOB TO PRODUCE AN ACCOUNTING LONG REPORT          -
//*          ORDERED BY PRIMARY AUTHID AND PLAN NAME           -
//*          FROM 00:00:00 - 23:59:59 HOURS FOR OCT. 16 - 18,    -
//*          SUMMARIZED IN INTERVALS OF 8 HOURS (480 MINUTES).  -
//*          ONLY AUTHIDS OF BPL2X OR THOSE BEGINNING WITH CJN*  -
//*          ARE SELECTED FOR THIS REPORT.                       -

Figure 138. Sample DPREPORT Job Control Statements for Accounting Reports

See “SMF Reporting Facilities (DPREPORT)” in the *MAINVIEW for DB2 Performance Reporter User Guide* for detailed information about each of the JCL control statements in the DPREPORT job.

### Reports from DB2 Tables

Printing workload reports is usually done from the DB2 tables of performance data supported by Performance Reporter. This gives you long-term history and trending, as well as the full flexibility of SQL for defining your own reports in addition to the predefined set. See “Reports from DB2 Tables” in the *MAINVIEW for DB2 Performance Reporter User Guide* for more information.

Performance Reporter provides predefined reports using SQL statements, which can be run through a batch reporting facility (DPRREPT) or through QMF queries. DB2 performance charts and plots are also provided, which are available through QMF only. Other queries and reports based on the performance data tables can also be defined.

#### Predefined Reports

The prepared reports included with Performance Reporter show DB2 system workload to help the DB2 performance analyst, capacity planner, or service manager solve specific DB2 problems. These reports are generated from accounting, statistics, and audit data.

With these reports, standard reporting can be run on a daily or weekly basis or both.

**Daily run**      The queries processed by the batch reporting program, DPRREPT, from the detail statistics (queries STxxx) and detail accounting (queries ACxxxx) tables are set up to produce a set of daily reports on the data loaded from the previous day (current date minus one). The sample JCL in BBSAMP named DPRRPT includes all distributed reports. Run these reports once, select those ACxxxx and STxxx reports you want to review daily, and create a job for this daily run.

**Note:** Generally, you will not want to load detail accounting records into table DMRACDTL, but only data summarized by hour or day into table DMRACSUM. In this case, delete the ACxxxx reports from the job and modify the date selection on the SAxxxx reports to produce your daily reports. The report results will be the same. Only the detailed exceptions report cannot be produced.

**Weekly run**      The queries processed by the batch reporting program, DPRREPT, from the summary accounting table (queries SAxxxx) are set up to produce a set of weekly reports on the data from the previous week (current date to current date minus seven). Select the SAxxx reports you want to review weekly and create a job for this weekly run.

**Note:** You can also summarize the daily table to other tables at a higher level, such as weekly or monthly. The SAxxx reports can also be used with these tables.

Any of the distributed SQL queries can be modified or used as a model to produce queries to satisfy ad hoc reporting needs. However, the flexibility of QMF, in general, makes it the better vehicle for such reporting. An added advantage with QMF is that the procs provide an easy way to select a specific time period for reporting without modifying the queries themselves.

## QMF Queries

QMF can be used to run distributed reports or tailor custom performance reports and charts. A generalized QMF procedure, DZPRQRPT, runs predefined Performance Reporter queries and formats the reports using the distributed Performance Reporter forms. The predefined reports produced with QMF are the same as those produced with the batch reporting facility, DPRREPT. However, with QMF, you can select a range of dates for these reports.

**Note:** You must enter the QMF program to use this procedure. Detailed instructions to run and use QMF can be found in the *IBM Query Management Facility Learner's Guide*.

To run the predefined Performance Reporter queries from QMF, type the command:

```
RUN DMRPR.DZPRQRPT (&REPORT=report name
```

where `report name` is the name of the report you want to produce. For example, to run the DB2 Accounting Overview Report, type

```
RUN DMRPR.DZPRQRPT (&REPORT=ACOVERA
```

The report table date range prompts FROM and TO might appear when running these queries under QMF. Type the date range you want using the standard TSI format:

```
'YYYY-MM-DD-HH.MM.SS.TTTTTT'
```

Or, you can set global report variables by typing one of these procs:

```
RUN DMRPR.DZPRQDAT
```

```
RUN DMRPR.DZPRQDEF
```

Once you have set these global variables, they will be used by all Performance Reporter report queries for the duration of the QMF session.

To produce QMF batch reports, use the sample jobs in BBSAMP member DZPRQBAT.

## Customizing Your Own Reports

Once you have used the Performance Reporter facilities to load data into DB2 tables, you may want to use your own reporting tools to create customized reports.

However, since Performance Reporter uses either QMF or a generalized report generator to provide reporting and charting facilities, the entire report is defined by the SQL select statement used to read the data tables. Thus, it is very easy to create customized reports for a specific requirement. The SQL select statements used to produce the distributed reports and charts are available, within the QMF or DPRREPT environments, as models in tailoring new reports or charts.

The JXREPT program is designed to run any SQL SELECT statement against the Performance Reporter tables and report the results.

See “Customizing Reports” in the *MAINVIEW for DB2 Performance Reporter User Guide* for more information.

One example of a custom report you may want to create is to change the time interval for reporting statistics data.

The default statistics reports show statistics by the DATETIME stamp in each record. To provide a historical view, you may want to modify the distributed reports to show statistics grouped by a longer time interval. To simplify this type of reporting, the statistics tables include columns for several other date and time values, such as DATE, MONTH, DAY, TIME, and HOUR.

**Note:** Data is not *spread* across intervals.

An example of a report by DATE and HOUR is in BBPARM member STOVERH, as shown in [Figure 139](#). See “Reporting Statistics Data by Time Interval” in the *MAINVIEW for DB2 Performance Reporter User Guide*.

## A

- accessing
  - MAINVIEW 6
  - thread history data 100
- accounting records
  - tutorial example
    - LTRAC display 77
    - STRAC display 78, 109
    - TSTAT display 91
- active requests
  - list of monitors 31, 37
- active threads
  - all 12
  - multiple DB2s 14
- Active Timer Request list
  - tutorial example 31, 37
  - select by area 38
- Activity Overview view 10, 16
- Activity Rates view 10
- Add SSI Context Definition panel 49
- All Active Threads view 12
- analyzer
  - tutorial example
    - Primary Option Menu selection 8
- application I/O analysis
  - tutorial example
    - activity by package/program 92
    - activity by page set 92, 117
    - activity by plan 92, 118
    - activity by SQL statement 93
    - asynchronous I/Os 92, 117
    - collecting I/O events 116
    - detail I/O events 93, 116
    - printing I/O reports 119
    - running a system I/O trace 116
    - summarized trace events 92, 93, 117
    - synchronous I/Os 92, 117
    - system-wide traces 115
    - total measurements 117
- application trace
  - tutorial example
    - access services 76
    - accessing EXPLAIN 136
    - activating 72
    - additional options 68
    - analyzing DB2 workload 99
    - avoiding expensive lock event traces 87
    - BIND-TEXT pop-up 130
    - buffer pool activity 80
    - collecting I/O events 116
    - database summary 85
    - defaults 67
    - detail entry display (DTRAC) 89, 130, 139
    - detail event summaries 82
    - detail events 70, 116
    - elapsed time 79
    - error messages 72
    - exception filters 69
    - EXPLAIN pop-up 131
    - I/O analysis 92, 115
    - improve performance 73, 124
    - list of current 66, 75
    - list of historical data sets 75, 94, 148
    - list of trace entries (LTRAC) 77

# END USER LICENSE AGREEMENT NOTICE

BY OPENING THE PACKAGE, INSTALLING, PRESSING "AGREE" OR "YES" OR USING THE PRODUCT, THE ENTITY OR INDIVIDUAL ENTERING INTO THIS AGREEMENT AGREES TO BE BOUND BY THE FOLLOWING TERMS. IF YOU DO NOT AGREE WITH ANY OF THESE TERMS, DO NOT INSTALL OR USE THE PRODUCT, PROMPTLY RETURN THE PRODUCT TO BMC OR YOUR BMC RESELLER, AND IF YOU ACQUIRED THE LICENSE WITHIN 30 DAYS OF THE DATE OF YOUR ORDER CONTACT BMC OR YOUR BMC RESELLER FOR A REFUND OF LICENSE FEES PAID. IF YOU REJECT THIS AGREEMENT, YOU WILL NOT ACQUIRE ANY LICENSE TO USE THE PRODUCT.

This Agreement ("**Agreement**") is between the entity or individual entering into this Agreement ("You") and BMC Software Distribution, Inc., a Delaware corporation located at 2101 CityWest Blvd., Houston, Texas, 77042, USA or its affiliated local licensing entity ("BMC"). "You" includes you and your Affiliates. "Affiliate" is defined as an entity which controls, is controlled by or shares common control with a party. THIS AGREEMENT WILL APPLY TO THE PRODUCT, UNLESS (1) YOU AGREED TO A WEB BASED LICENSE AGREEMENT WITH BMC WHEN ORDERING THE PRODUCT, IN WHICH CASE THAT WEB BASED LICENSE AGREEMENT GOVERNS THE USE OF THE PRODUCT, OR (2) IF YOU DID NOT AGREE TO A WEB BASED LICENSE AGREEMENT WITH BMC WHEN ORDERING THE PRODUCT AND YOU HAVE A WRITTEN LICENSE AGREEMENT WITH BMC, THEN THAT WRITTEN AGREEMENT GOVERNS THE USE OF THE PRODUCT. THE ELECTRONIC AGREEMENT PROVIDED WITH THE PRODUCT AS PART OF THE INSTALLATION OF THE PRODUCT WILL NOT APPLY. In addition to the restrictions imposed under this Agreement, any other usage restrictions contained in the Product installation instructions or release notes shall apply to Your use of the Product.

**PRODUCT AND CAPACITY.** "**Software**" means the object code version of the computer programs provided, via delivery or electronic transmission, to You. Software includes computer files, enhancements, maintenance modifications, upgrades, updates, bug fixes, and error corrections.

"**Documentation**" means all written or graphical material provided by BMC in any medium, including any technical specifications, relating to the functionality or operation of the Software.

"**Product**" means the Software and Documentation.

"**License Capacity**" means the licensed capacity for the Software with the pricing and other license defining terms, including capacity restrictions, such as tier limit, total allowed users, gigabyte limit, quantity of Software, and/or other capacity limitations regarding the Software. For licenses based on the power of a computer, You agree to use BMC's current computer classification scheme, which is available at <http://www.bmc.com> or can be provided to You upon request.

**ACCEPTANCE.** The Product is deemed accepted by You, on the date that You received the Product from BMC.

**LICENSE.** Subject to the terms of this Agreement, as well as Your payment of applicable fees, BMC grants You a non-exclusive, non-transferable, perpetual (unless a term license is provided on an order) license for each copy of the Software, up to the License Capacity, to do the following:

- (a) install the Software on Your owned or leased hardware located at a facility owned or controlled by You in the country where You acquired the license;
- (b) operate the Software solely for processing Your own data in Your business operations; and
- (c) make one copy of the Software for backup and archival purposes only (collectively a "**License**").

If the Software is designed by BMC to permit you to modify such Software, then you agree to only use such modifications or new software programs for Your internal purposes or otherwise consistent with the License. BMC grants You a license to use the Documentation solely for Your internal use in Your operations.

**LICENSE UPGRADES.** You may expand the scope of the License Capacity only pursuant to a separate agreement with BMC for such expanded usage and Your payment of applicable fees. There is no additional warranty period or free support period for license upgrades.

**RESTRICTIONS:** You agree to **NOT**:

- (a) disassemble, reverse engineer, decompile or otherwise attempt to derive any Software from executable code;
- (b) distribute or provide the Software to any third party (including without limitation, use in a service bureau, outsourcing environment, or processing the data of third parties, or for rental, lease, or sublicense); or
- (c) provide a third party with the results of any functional evaluation or benchmarking or performance tests, without BMC's prior written approval, unless prohibited by local law.

**TRIAL LICENSE.** If, as part of the ordering process, the Product is provided on a trial basis, then these terms apply: (i) this license consists solely of a non-exclusive, non-transferable evaluation license to operate the Software for the period of time specified from BMC or, if not specified, a 30 day time period ("**Trial Period**") only for evaluating whether You desire to acquire a capacity-based license to the Product for a fee; and (ii) Your use of the Product is on an AS IS basis without any warranty, and **BMC, ITS AFFILIATES AND RESELLERS, AND LICENSORS DISCLAIM ANY AND ALL WARRANTIES (INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT) AND HAVE NO LIABILITY WHATSOEVER RESULTING FROM THE USE OF THIS PRODUCT UNDER THIS TRIAL LICENSE ("Trial License").** BMC may terminate for its convenience a Trial License upon notice to You. When the Trial Period ends, Your right to use this Product automatically expires. If You want to continue Your use of the Product beyond the Trial Period, contact BMC to acquire a capacity-based license to the Product for a fee.

**TERMINATION.** This Agreement shall immediately terminate if You breach any of its terms. Upon termination, for any reason, You must uninstall the Software, and either certify the destruction of the Product or return it to BMC.

**OWNERSHIP OF THE PRODUCT.** BMC or its Affiliates or licensors retain all right, title and interest to and in the BMC Product and all intellectual property, informational, industrial property and proprietary rights therein. BMC neither grants nor otherwise transfers any rights of ownership in the BMC Product to You. BMC Products are protected by applicable copyright, trade secret, and industrial and intellectual property laws. BMC reserves any rights not expressly granted to You herein.

**CONFIDENTIAL AND PROPRIETARY INFORMATION.** The BMC Products are and contain valuable confidential information of BMC ("Confidential Information"). Confidential Information means non-public technical and non-technical information relating to the BMC Products and Support, including, without limitation, trade secret and proprietary information, and the structure and organization of the Software. You may not disclose the Confidential Information to third parties. You agree to use all reasonable efforts to prevent the unauthorized use, copying, publication or dissemination of the Product.

**WARRANTY.** Except for a Trial License, BMC warrants that the Software will perform in substantial accordance with the Documentation for a period of one year from the date of the order. This warranty shall not apply to any problems caused by software or hardware not supplied by BMC or to any misuse of the Software.

**EXCLUSIVE REMEDY.** BMC's entire liability, and Your exclusive remedy, for any defect in the Software during the warranty period or breach of the warranty above shall be limited to the following: BMC shall use reasonable efforts to remedy defects covered by the warranty or replace the defective Software within a reasonable period of time, or if BMC cannot remedy or replace such defective copy of the Software, then BMC shall refund the amount paid by You for the License for that Software. BMC's obligations in this section are conditioned upon Your providing BMC prompt access to the affected Software and full cooperation in resolving the claim.

**DISCLAIMER. EXCEPT FOR THE EXPRESS WARRANTIES ABOVE, THE PRODUCT IS PROVIDED "AS IS." BMC, ITS AFFILIATES AND LICENSORS SPECIFICALLY DISCLAIM ALL OTHER WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT. BMC DOES NOT WARRANT THAT THE OPERATION OF THE SOFTWARE WILL BE UNINTERRUPTED OR ERROR FREE, OR THAT ALL DEFECTS CAN BE CORRECTED.**

**DISCLAIMER OF DAMAGES. IN NO EVENT IS BMC, ITS AFFILIATES OR LICENSORS LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL, PUNITIVE OR CONSEQUENTIAL DAMAGES RELATING TO OR ARISING OUT OF THIS AGREEMENT, SUPPORT, AND/OR THE PRODUCT (INCLUDING, WITHOUT LIMITATION, LOST PROFITS, LOST COMPUTER USAGE TIME, AND DAMAGE OR LOSS OF USE OF DATA), EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, AND IRRESPECTIVE OF ANY NEGLIGENCE OF BMC OR WHETHER SUCH DAMAGES RESULT FROM A CLAIM ARISING UNDER TORT OR CONTRACT LAW.**

**LIMITS ON LIABILITY. BMC'S AGGREGATE LIABILITY FOR DAMAGES IS LIMITED TO THE AMOUNT PAID BY YOU FOR THE LICENSE TO THE PRODUCT.**

**SUPPORT.** If Your order includes support for the Software, then BMC agrees to provide support (24 hours a day/7 days a week) ("Support"). You will be automatically re-enrolled in Support on an annual basis unless BMC receives notice of termination from You as provided below. There is a free support period during the one year warranty period.

(a) **Support Terms.** BMC agrees to make commercially reasonable efforts to provide the following Support: (i) For malfunctions of supported versions of the Software, BMC provides bug fixes, patches or workarounds in order to cause that copy of the Software to operate in substantial conformity with its then-current operating specifications; and (ii) BMC provides new releases or versions, so long as such new releases or versions are furnished by BMC to all other enrolled Support customers without additional charge. BMC may refuse to provide Support for any versions or releases of the Software other than the most recent version or release of such Software made available by BMC. Either party may terminate Your enrollment in Support upon providing notice to the other at least 30 days prior to the next applicable Support anniversary date. If You re-enroll in Support, BMC may charge You a reinstatement fee of 1.5 times what You would have paid if You were enrolled in Support during that time period.

(b) **Fees.** The annual fee for Support is 20% of the Software's list price less the applicable discount or a flat capacity based annual fee. BMC may change its prices for the Software and/or Support upon at least 30 days notice prior to Your support anniversary date.

**VERIFICATION.** If requested by BMC, You agree to deliver to BMC periodic written reports, whether generated manually or electronically, detailing Your use of the Software in accordance with this Agreement, including, without limitation, the License Capacity. BMC may, at its expense, audit Your use of the Software to confirm Your compliance with the Agreement. If an audit reveals that You have underpaid fees, You agree to pay such underpaid fees. If the underpaid fees exceed 5% of the fees paid, then You agree to also pay BMC's reasonable costs of conducting the audit.

**EXPORT CONTROLS.** You agree not to import, export, re-export, or transfer, directly or indirectly, any part of the Product or any underlying information or technology except in full compliance with all United States, foreign and other applicable laws and regulations.

**GOVERNING LAW.** This Agreement is governed by the substantive laws in force, without regard to conflict of laws principles: (a) in the State of New York, if you acquired the License in the United States, Puerto Rico, or any country in Central or South America; (b) in the Province of Ontario, if you acquired the License in Canada (subsections (a) and (b) collectively referred to as the "**Americas Region**"); (c) in Singapore, if you acquired the License in Japan, South Korea, Peoples Republic of China, Special Administrative Region of Hong Kong, Republic of China, Philippines, Indonesia, Malaysia, Singapore, India, Australia, New Zealand, or Thailand (collectively, "**Asia Pacific Region**"); or (d) in the Netherlands, if you acquired the License in any other country not described above. The United Nations Convention on Contracts for the International Sale of Goods is specifically disclaimed in its entirety.

**ARBITRATION. ANY DISPUTE BETWEEN YOU AND BMC ARISING OUT OF THIS AGREEMENT OR THE BREACH OR ALLEGED BREACH, SHALL BE DETERMINED BY BINDING ARBITRATION CONDUCTED IN ENGLISH. IF THE DISPUTE IS INITIATED IN THE AMERICAS REGION, THE ARBITRATION SHALL BE HELD IN NEW YORK, U.S.A., UNDER THE CURRENT COMMERCIAL OR INTERNATIONAL, AS APPLICABLE, RULES OF THE AMERICAN ARBITRATION ASSOCIATION. IF THE DISPUTE IS INITIATED IN A COUNTRY IN THE ASIA PACIFIC REGION, THE ARBITRATION SHALL BE HELD IN SINGAPORE, SINGAPORE UNDER THE CURRENT UNCITRAL ARBITRATION RULES. IF THE DISPUTE IS INITIATED IN A COUNTRY OUTSIDE OF THE AMERICAS REGION OR ASIA PACIFIC REGION, THE ARBITRATION SHALL BE HELD IN AMSTERDAM, NETHERLANDS UNDER THE CURRENT UNCITRAL ARBITRATION RULES. THE COSTS OF THE ARBITRATION SHALL BE BORNE EQUALLY PENDING THE ARBITRATOR'S AWARD. THE AWARD RENDERED SHALL BE FINAL AND BINDING UPON THE PARTIES AND SHALL NOT BE SUBJECT TO APPEAL TO ANY COURT, AND MAY BE ENFORCED IN ANY COURT OF COMPETENT JURISDICTION. NOTHING IN THIS AGREEMENT SHALL BE DEEMED AS PREVENTING EITHER PARTY FROM SEEKING INJUNCTIVE RELIEF FROM ANY COURT HAVING JURISDICTION OVER THE PARTIES AND THE SUBJECT MATTER OF THE DISPUTE AS NECESSARY TO PROTECT EITHER PARTY'S CONFIDENTIAL INFORMATION, OWNERSHIP, OR ANY OTHER**

**PROPRIETARY RIGHTS. ALL ARBITRATION PROCEEDINGS SHALL BE CONDUCTED IN CONFIDENCE, AND THE PARTY PREVAILING IN ARBITRATION SHALL BE ENTITLED TO RECOVER ITS REASONABLE ATTORNEYS' FEES AND NECESSARY COSTS INCURRED RELATED THERETO FROM THE OTHER PARTY.**

**U.S. GOVERNMENT RESTRICTED RIGHTS.** The Software under this Agreement is "commercial computer software" as that term is described in 48 C.F.R. 252.227-7014(a)(1). If acquired by or on behalf of a civilian agency, the U.S. Government acquires this commercial computer software and/or commercial computer software documentation subject to the terms of this Agreement as specified in 48 C.F.R. 12.212 (Computer Software) and 12.211 (Technical Data) of the Federal Acquisition Regulations ("**FAR**") and its successors. If acquired by or on behalf of any agency within the Department of Defense ("**DOD**"), the U.S. Government acquires this commercial computer software and/or commercial computer software documentation subject to the terms of this Agreement as specified in 48 C.F.R. 227.7202 of the DOD FAR Supplement and its successors.

**MISCELLANEOUS TERMS.** You agree to pay BMC all amounts owed no later than 30 days from the date of the applicable invoice, unless otherwise provided on the order for the License to the Products. You will pay, or reimburse BMC, for taxes of any kind, including sales, use, duty, tariffs, customs, withholding, property, value-added (VAT), and other similar federal, state or local taxes (other than taxes based on BMC's net income) imposed in connection with the Product and/or the Support. This Agreement constitutes the entire agreement between You and BMC and supersedes any prior or contemporaneous negotiations or agreements, whether oral, written or displayed electronically, concerning the Product and related subject matter. No modification or waiver of any provision hereof will be effective unless made in a writing signed by both BMC and You. You may not assign or transfer this Agreement or a License to a third party without BMC's prior written consent. Should any provision of this Agreement be invalid or unenforceable, the remainder of the provisions will remain in effect. The parties have agreed that this Agreement and the documents related thereto be drawn up in the English language. Les parties exigent que la présente convention ainsi que les documents qui s'y rattachent soient rédigés en anglais.
